2.1 **CHAPTER 2 CONTENTS**

2.1	CHAPTER 2 CONTENTS		
2.2	INTRODUCTION		
2.3	CONCEPTUAL APPROACH		
2.3	3.1 TRIGGER EVENTS		
2.3	3.2 ACKNOWLEDGMENTS: ORIGINAL MODE		
2.3	3.3 ACKNOWLEDGMENTS: ENHANCED MODE		
2.3	3.4 QUERIES		
2.4	COMMUNICATIONS ENVIRONMENT		
2.5	HL7 MESSAGES		
2.6	SEGMENTS	2-12	
2.7	FIELDS		
2.7	7.1 Position (sequence within the segment)		
2.7	7.2 MAXIMUM LENGTH		
2.7	7.3 DATA ТҮРЕ		
2.7	7.4 Optionality		
2.7			
2.7			
2.7			
2.7	7.8 NAME		
2.8	MESSAGE DELIMITERS		
2.9	DATA TYPES	2-17	
2.9	9.1 AD - ADDRESS		
Health	h Level Seven, Version 2.4 © 2000. All rights reserved.	Page 2-1	

2.9.1.1	Street address (ST)	2-23
2.9.1.2	Other designation (ST)	
2.9.1.2	City (ST)	
2.9.1.3	State or province (ST)	
2.9.1.4	Zip or postal code (ST)	
	Country (ID)	
2.9.1.6		
2.9.1.7	Address type (ID)	
2.9.1.8	Other geographic designation (ST)	
	CD - CHANNEL DEFINITION	
	CE - CODED ELEMENT	
2.9.3.1	Identifier (ST)	
2.9.3.2	<i>Text</i> (<i>ST</i>)	
2.9.3.3	Name of coding system (IS)	
2.9.3.4	Alternate identifier (ST)	
2.9.3.5	Alternate text (ST)	
2.9.3.6	Name of alternate coding system (IS)	
	CF - CODED ELEMENT WITH FORMATTED VALUES	
2.9.5 0	K - COMPOSITE ID WITH CHECK DIGIT	2-26
2.9.5.1	ID number (NM)	2-26
2.9.5.2	Check digit (NM)	2-26
2.9.5.3	Code identifying the check digit scheme employed (ID)	
2.9.5.4	Assigning authority (HD)	
	CM - COMPOSITE	
	N - COMPOSITE ID NUMBER AND NAME	
2.9.7.1	ID number (ST)	
2.9.7.2	Family name (FN)	
2.9.7.2	Given name (ST)	
2.9.7.3	second and further given names or initials thereof (ST)	
2.9.7.4	Suffix (ST)	
2.9.7.5	Prefix (ST)	
2.9.7.7	Degree (IS)	
2.9.7.8	Source table (IS)	
2.9.7.9	Assigning authority (HD)	
	CNE – CODED WITH NO EXCEPTIONS	
2.9.8.1	Identifier (ST)	
2.9.8.2	Text (ST)	
2.9.8.3	Name of coding system (IS)	
2.9.8.4	Alternate identifier (ST)	
2.9.8.5	Alternate text (ST)	
2.9.8.6	Name of alternate coding system (IS)	
2.9.8.7	Coding system version ID (ST)	
2.9.8.8	Alternate coding system version ID (ST)	2-31
2.9.8.9	Original text (ST)	2-31
2.9.8.10	Usage notes:	2-31
2.9.9	CP - COMPOSITE PRICE	2-33
2.9.9.1	<i>Price (MO)</i>	2-33
2.9.9.2	Price type (ID)	2-33
2.9.9.3	From value (NM)	
2.9.9.4	To value (NM).	
2.9.9.5	Range units (CE)	
2.9.9.6	Range type (ID)	
	CQ - COMPOSITE QUANTITY WITH UNITS	
2.9.10.1	Quantity (NM)	
2.9.10.2	Units (CE)	
	CWE – CODED WITH EXCEPTIONS	
2.9.11.1	Identifier (ST)	
2.7.11.1	incomptor (SI)	2 55

2.9.11.2	Text (ST)	2-35
2.9.11.3	Name of coding system (IS)	2-35
2.9.11.4	Alternate identifier (ST)	
2.9.11.5	Alternate text (ST).	
2.9.11.6	Name of alternate coding system (IS)	
2.9.11.7	Coding system version ID (ST)	
2.9.11.8	Alternate coding system version ID (ST)	
2.9.11.9	Original text (ST)	
2.9.11.10	Usage notes:	
	- EXTENDED COMPOSITE ID WITH CHECK DIGIT	
2.9.12.1	ID (ST)	
2.9.12.2	Check digit (ST)	
2.9.12.2	Code identifying the check digit scheme employed (ID)	
2.9.12.3	Assigning authority (HD)	
2.9.12.4	Identifier type code (ID)	
2.9.12.5	Assigning facility (HD)	
2.9.12.0	Effective date (DT)	
2.9.12.7	Expiration date (DT)	
	V - DRIVER'S LICENSE NUMBER	
2.9.13 DL1 2.9.13.1	Driver's license number (as ST data type)	
2.9.13.1	Issuing state, province, country (IS)	
2.9.13.2	Expiration date (DT)	
	- DATE/TIME RANGE	
2.9.14.1 2.9.14.2	Range start date/time (TS) Range end date/time (TS)	
	- DATE	
	- ENCAPSULATED DATA	
2.9.16.1	Source application (HD)	
2.9.16.2	Type of data (ID)	
2.9.16.3	Data subtype (ID)	
2.9.16.4	Encoding (ID)	
2.9.16.5	Data (ST)	
	ENTITY IDENTIFIER	
2.9.17.1	Entity identifier (ST)	
2.9.17.2	Namespace ID (IS)	
2.9.17.3	Universal ID (ST)	
2.9.17.4	Universal ID type (ID)	
	- FINANCIAL CLASS	
2.9.18.1	Financial class (IS)	
2.9.18.2	Effective date (TS)	
	- FAMILY NAME	
2.9.19.1	Surname (ST)	
2.9.19.2	Own surname prefix (ST)	
2.9.19.3	Own surname (ST)	
2.9.19.4	Surname prefix from partner/spouse (ST)	
2.9.19.5	Surname from partner/spouse (ST)	
	- FORMATTED TEXT DATA	
	- HIERARCHIC DESIGNATOR	
2.9.21.1	Namespace ID (IS)	
2.9.21.2	Universal ID (ST)	
2.9.21.3	Universal ID type (ID)	
	CODED VALUE FOR HL7 DEFINED TABLES	
	CODED VALUE FOR USER-DEFINED TABLES	
	- JOB CODE/CLASS	
2.9.24.1	Job code (IS)	
2.9.24.2	Job class (IS)	2-49

Page 2-3

2.2 INTRODUCTION

The Control chapter of this Standard defines the generic rules that apply to all messages. Subsequent sections define functionally specific messages to be exchanged among certain applications. The specific aspects of message definition that are addressed herein are:

- a) the form to be used in functional chapters for describing messages. This includes their purpose, their contents, and the interrelationships among them. This form is called an abstract message definition because it is purely a level 7 (application) definition.
- b) the HL7 encoding rules for converting an abstract message into a string of characters that comprises an actual message
- c) the programming procedures required to exchange messages using the HL7 specifications
- d) the anticipated relationship with lower level protocols
- e) certain message segments that are components of all messages
- f) a single message, the acknowledgment message, that may be used unchanged in multiple applications.

2.3 CONCEPTUAL APPROACH

2.3.1 Trigger events

The Standard is written from the assumption that an event in the real world of healthcare creates the need for data to flow among systems. The real-world event is called the **trigger event**. For example, the trigger event **a patient is admitted** may cause the need for data about that patient to be sent to a number of other systems. The trigger event, **an observation (e.g., a CBC result) for a patient is available,** may cause the need for that observation to be sent to a number of other systems. When the transfer of information is initiated by the application system that deals with the triggering event, the transaction is termed an **unsolicited update**.

Note: No assumption is made about the design or architecture of the application system creating the unsolicited update. The scope of HL7 is restricted to the specification of messages between application systems and the events triggering them.

HL7 allows the use of trigger events at several different levels of data granularity and inter-relationships. For example, most Patient Administration (ADT) trigger events concern single objects (such as an admit event, which creates a message that contains data about a single person and/or account). Other ADT trigger events are concerned with relationships between more than one object (e.g., the merge events, which specify patient or account merges). Some ADT trigger events pertain to a collection of objects that may have no significant inter-relationships (e.g., a record-oriented location-based query, whose response contains data about a collection of inpatients who are related only temporarily by local geography).

2.3.2 Acknowledgments: original mode

When the unsolicited update is sent from one system to another, this acknowledgment mode specifies that it be acknowledged at the application level. The reasoning is that it is not sufficient to know that the underlying communications system guaranteed delivery of the message. It is also necessary to know that the receiving application processed the data successfully at a logical application level.

The acknowledgment may contain data of interest to the system that initiated the exchange. For example, if a patient care system has processed the trigger event **a lab test is ordered for a patient**, it may send an unsolicited update to a lab application identifying the patient, the test ordered, and various other information about the order. The ancillary system will acknowledge the order when it has processed it successfully. For some pairings of patient care and ancillary department systems the acknowledgment may also include the ancillary identification number that was assigned. (HL7 does not require Order Entry and Results Reporting applications to interface in this manner, but it supports those that do.)

The HL7 Standard makes no assumptions about the ownership of data. It also makes no requirements of its own on the subsequent action of the recipient of data, nor does it make any assumption about the design or architecture of the receiving application system. The scope of HL7 is restricted to the specification of messages between application systems, and the events triggering them. HL7 does not explicitly support, but can be used with, systems that support store and forward and data broadcast facilities (see the HL7 Implementation Support Guide).

The HL7 Standard makes no functional interpretation of the requirement that a system commit the data in a message to its database before acknowledging it. All that is required is that the receiving system accept responsibility for the data, providing the same integrity test that it would apply to data from any source. To continue the prior example, the ancillary system may acknowledge the order after placing it in an input queue, expecting to fully process the order into its database at a future time. The only assumption is that the input queue is maintained at the same level of integrity as the database.

2.3.3 Acknowledgments: enhanced mode

The HL7 acknowledgment paradigm has been extended to distinguish both accept and application acknowledgments, as well the conditions under which each is required. With a positive accept acknowledgment, the receiving system commits the message to safe storage in a manner that releases the sending system from the need to resend the message. After the message has been processed by the receiving system, an application acknowledgment may be used to return the resultant status to the sending system.

2.3.4 Queries

Query documentation including messages, segments, special protocols, implementation considerations and examples have been moved to chapter 5. The unsolicited display messages were also moved because their message syntax is query-like in nature.

2.4 COMMUNICATIONS ENVIRONMENT

The HL7 Standard defines the messages as they are exchanged among application entities and the procedures used to exchange them. As such, it conceptually operates at the seventh level of the ISO model for Open System Interconnection (OSI). It is primarily concerned with the data content and interrelationship of messages and with communicating certain application-level error conditions.

Since the OSI protocols are not universally implemented, the HL7 Working Group is interested in providing standards that will be useful in the interim. It is also recognized that there is now, and will continue to be, interest in communicating health data among systems operating in communications environments that provide a high level of functionality, but use protocols other than ISO OSI. The universe of environments of interest to HL7 includes, but is not restricted to:

- a) ad hoc environments that do not provide even basic transport reliability. Such environments consist of point-to-point RS-232 links, modems, and even LANs, if their connection to host computers is made via RS-232 communications links. Until OSI high level standards become truly prevalent, many healthcare interfaces will be implemented over such links. In such an environment, the HL7 Lower Level Protocols (LLP) may be used between systems to enhance the capabilities of the communications environment. The HL7 Lower Level Protocols are defined in the HL7 Implementation Guide, which is not an official part of the Standard.
- b) environments that support a robust transport level, but do not meet the high level requirements. This includes environments such as TCP/IP, DECNET, and SNA.
- c) ISO and proprietary networks that implement up to presentation and other high level services. IBM's SNA LU6.2 and SUN Microsystems's NFS are examples of complete proprietary networks.
- d) two or more applications running on the same physical and/or logical machine that are not tightly integrated. In these environments, the messaging capabilities may be provided by inter-process communications services (e.g., Pipes in a UNIX System).

The HL7 Standard assumes that the communications environment will provide the following capabilities:

- a) error free transmission. Applications can assume that they correctly received all of the transmitted bytes in the order in which they were sent. This implies that error checking is done at a lower level. However, sending applications may not assume that the message was actually received without receiving an acknowledgment message.
- b) character conversion. If the two machines exchanging data use different representations of the same character set, the communications environment will convert the data from one representation to the other.

Health Level Seven, Version 2.4 © 2000. All rights reserved.

c) message length. HL7 sets no limits on the maximum size of HL7 messages. The Standard assumes that the communications environment can transport messages of any length that might be necessary. In practice, sites may agree to place some upper bound on the size of messages and may use the message continuation protocol, described later in this chapter, for messages that exceed the upper limit.

Note: Just as HL7 makes no assumptions about the design or architecture of the application systems sending and receiving HL7 messages, it makes no assumptions about the communications environment beyond those listed above. In particular, aside from the above assumptions, the communications environment, including its architecture, design and implementation, is outside the scope of HL7.

2.5 HL7 MESSAGES

This section and Sections 2.6, "SEGMENTS," through 2.10, "Use of escape sequences in text fields," define the components of messages and provide the methodology for defining abstract messages that are used in later chapters. A **message** is the atomic unit of data transferred between systems. It is comprised of a group of segments in a defined sequence. Each message has a **message type** that defines its purpose. For example the ADT Message type is used to transmit portions of a patient's Patient Administration (ADT) data from one system to another. A three-character code contained within each message identifies its type. These are listed in the Message Type list, Appendix A.

The real-world event that initiates an exchange of messages is called a trigger event. (See Section 2.3.1, "Trigger events," for a more detailed description of trigger events.) Appendix A contains the codes that represent all defined trigger events. These codes represent values such as **A patient is admitted** or **An order event occurred**. There is a one-to-many relationship between message types and trigger event codes. The same trigger event code may not be associated with more than one message type; however a message type may be associated with more than one trigger event.

All message types and trigger event codes beginning with the letter "Z" are reserved for locally-defined messages. No such codes will be defined within the HL7 Standard.

2.6 SEGMENTS

A **segment** is a logical grouping of **data fields**. Segments of a message may be required or optional. They may occur only once in a message or they may be allowed to repeat. Each segment is given a name. For example, the ADT message may contain the following segments: Message Header (MSH), Event Type (EVN), Patient ID (PID), and Patient Visit (PV1).

Each segment is identified by a unique three-character code known as the Segment ID. Although the actual segments are defined in various chapters, the ID codes assigned to the various segments are listed in Appendix A.

All segment ID codes beginning with the letter \mathbf{Z} are reserved for locally-defined messages. No such codes will be defined within the HL7 Standard.

2.7 FIELDS

Definition: A field is a string of characters.

HL7 does not care how systems actually store data within an application. When fields are transmitted, they are sent as character strings. Except where noted, HL7 data fields may take on the null value. Sending the null value, which is transmitted as two double quote marks (""), is different from omitting an optional data field. The difference appears when the contents of a message will be used to update a record in a database rather than create a new one. If no value is sent, (i.e., it is omitted) the old value should remain unchanged. If the null value is sent, the old value should be changed to null. (For further details, see Section 2.11, "Message construction rules," - step 2d.)

The various chapters of the Standard contain segment attribute tables. These tables list and describe the data fields in the segment and characteristics of their usage. A comprehensive data dictionary of all HL7 fields is provided in Appendix A. In defining a segment, the following information is specified about each field:

2.7.1 Position (sequence within the segment)

Definition: Ordinal position of the data field within the segment. This number is used to refer to the data field in the text comments that follow the segment definition table.

In the segment attribute tables this information is provided in the column labeled SEQ.

2.7.2 Maximum length

Definition: Maximum number of characters that one occurrence of the data field may occupy.

In the segment attribute tables this information is in a column labeled LEN.

The maximum length is not of conceptual importance in the abstract message or the HL7 coding rules. The length of a field is normative, but can be changed on a site specific basis. It is calculated to include the component and subcomponent separators that are defined below. Because the maximum length is that of a single occurrence, the repetition separator is not included in calculating the maximum length (See Section 2.7.5, "Repetition"). A composite data type may not have a maximum length less than the maximum length of its largest component data type (i.e., in PID-3, CX includes HD, which in turn includes an IS, ID, and ST).

The following conventions have been applied:

- 1) The maximum length of the data field shall be expressed as a number.
- 2) If the maximum length needs to convey the notion of a Very Large Number, the number 65536 should be displayed to alert the user. This convention takes the place of the practice in versions prior to 2.4 of abbreviating this expression as 64K.
- 3) If the maximum length cannot be definitively expressed because the data type for the field is variable, the symbolic number 99999 should be displayed. This convention takes the place of the practice in versions prior to 2.4 of displaying the notation "varies" or some other non-numeric description.

The following maximum field lengths are specified:

		-
Field Type	Data Type	Length
Coded fields:	CE	250
	СХ	250
	CNE	250
	CWE	250
	СК	250
	CN	250
Phone number field:	XTN	250

Maximum Field Lengths

	1	1
Name fields:	XCN	250
	XPN	250
	XON	250
	PPN	250
Address fields:	XAD	250

2.7.3 Data type

Definition: Restrictions on the contents of the data field.

In the segment attribute tables this information is provided in the column labeled **DT**. If the data type of the field is variable, the notation "varies" will be displayed.

There are a number of data types defined by HL7. These are explained in Section 2.9, "Data types."

2.7.4 Optionality

Definition: Whether the field is required, optional, or conditional in a segment.

In the segment attribute tables this information is provided in the column labeled **OPT**.

The designations for optionality are:

- R required
- O optional
- C conditional on the trigger event or on some other field(s). The field definitions following the segment attribute table should specify the algorithm that defines the conditionality for this field.
- X not used with this trigger event
- B left in for backward compatibility with previous versions of HL7. The field definitions following the segment attribute table should denote the optionality of the field for prior versions.

Note: For Versions 2.3 and higher: the optionality of fields should be explicitly documented in the segment field definitions that follow each segment definition table; if the optionality of fields within a segment changes depending on the trigger event, that optionality should also be explicitly documented.

For fields defined by HL7 data types containing multiple components or subcomponents, the optionality of a given component or subcomponent must be specified in the detailed field definitions that follow the formal segment attribute tables. (See also Sections 2.8, "MESSAGE DELIMITERS," 2.9, "Data types," and 2.11, "Message construction rules").

2.7.5 Repetition

Definition: Whether the field may repeat.

In the segment attribute tables this information is provided in the column labeled **RP**/#.

The designations for Repetition are:

N or blank	-	no repetition
Y	-	the field may repeat an indefinite or site-determined number of times
(integer)	-	the field may repeat up to the number of times specified by the integer

Each occurrence may contain the number of characters specified by the field's maximum length. (See Section 2.7.2, "Maximum length.")

Usage Note: For improved readability some technical committees opt to leave the Repetition fields blank to indicate that the field may NOT repeat. A blank may NOT be construed to mean that the field may optionally repeat.

2.7.6 Table

Definition: The table attribute of the data field definition specifies the HL7 identifier for a set of coded values.

In the segment attribute tables, the table identifier is provided in the column labeled **TBL#**. An entry in the table number column means that the table name and the element name are equivalent. If this attribute is not valued or blank, there is not a table of values defined for the field.

A number of conventions have been applied to this attribute of the data field definition.

- 1. If more than one table is applicable, the format xxxx/yyyy will be used to so designate multiple tables. Details on multiple tables will be specified in field notes.
- 2. If the field is of data type ID or IS a table number will be allocated even if, in the case of IS, there may be a notation "No Suggested values"
- 3. If the field is of data type CE and one or more externally or locally defined tables may be used, the symbolic number 9999 will appear in the column. This is to indicate that table values are used, but no HL7/User Defined table can be allocated. The narrative may constrain which external tables can be used.
- 4. Tables embedded in field components or subcomponents will not be cited in the attribute column. The exception to this convention are the CE, CNE, CWE and CF data types where the table is dependent on the field context. This also applies to the CM data type if it contains embedded tables.
 - a) Data types having embedded tables are identified in *HL7 Table 440 -Data types*. These tables are defined in the data type section. They may, however, be constrained in the field note section. The field note definition supercedes the definition in the data type section.
 - b) Tables embedded in fields with a data type of CE, CF CNE, CM or CWE are only defined in the field notes section.

HL7 defines table values in 3 ways: HL7 defined, user-defined and externally defined

User-defined Tables: A user-defined table is a set of values that are locally or site defined. This accommodates certain fields, like *PVI-3 - Assigned patient location*, that will have values that vary from institution to institution. Even though these tables are not defined in the Standard, they are given a user-defined table number to facilitate implementations. HL7 sometimes publishes suggested values that a site may use

Page 2-15

as a starter set (e.g., *table 0001- Sex*). The IS data type is often used to encode values for these tables. Note that some of these tables (e.g., *table - 0302 Point of care*) may reference common master files.

There are some user-defined tables that contain values that might be standardized across institutions but for which no applicable official standard exists. For these a set of **suggested** values may be listed in Appendix A. These suggested values appear in the text in a standard box format (e.g., *HL7 Table 0062 - Event reason* in Section 3.4.1.4, "Event reason code"). It is recommended that these values be used where applicable within an institution and serve as a basis for extensions as required. These values may, however, be redefined locally. The appropriate functional committee within HL7 solicits suggestions for additional values from institutions that are applying the Standard.

HL7 Tables: An HL7 table is a set of values defined and published by HL7. They are a part of the HL7 Standard because they affect the interpretation of the messages that contain them. These values may not be redefined locally; however, the table itself may be extended to accommodate locally defined values. This is particularly applicable in the case of *HL7 table 0003 – Event Type*. The ID data type is most often used to encode values for HL7 tables. The values are listed in Appendix A. These HL7 tables also appear in the text in a standard box format (e.g., *HL7 table 0003 Event Type*)

External Tables: An external table is a set of coded values defined and published by another standards organization. External tables are used to populate fields like *FT1-19-Diagnosis Code - FT1*. Another example, the encoding of clinical observations using LOINC codes. The CE data type is used to represent values for these fields.

Table numbers 9000 and above are reserved for externally-defined tables published by HL7. Such tables arise from applications where the concepts and possibly the codes are established by external agencies due to regulatory requirements or agreements between HL7 and other Standards Developing Organizations. They are published by HL7 on behalf of other organizations. Their contents are not subject to approval by HL7 ballot. Such tables will be published with HL7 Standards. However, they may be updated more frequently than HL7 Standards. HL7 will provide free downloads of the most recent versions of these tables via the Internet without requiring membership in HL7.

2.7.7 ID number

Small integer that uniquely identifies the data item throughout the Standard. In the segment definition this information is provided in the column labeled **ITEM #.**

2.7.8 Name

Descriptive name for the data item. In the segment attribute tables this information is provided in the column labeled **ELEMENT NAME**.

When the same name is used in more than one segment, it must have the same data type and semantic meaning in each segment as well as the same ID number. To deal with any ambiguities arising from this convention, whenever a field is referenced herein, the segment name and position must always be included.

2.8 MESSAGE DELIMITERS

In constructing a message, certain special characters are used. They are the segment terminator, the field separator, the component separator, subcomponent separator, repetition separator, and escape character. The segment terminator is always a carriage return (in ASCII, a hex 0D). The other delimiters are defined in the MSH segment, with the field delimiter in the 4th character position, and the other delimiters occurring as in the field called Encoding Characters, which is the first field after the segment ID. The delimiter values used in the MSH segment

Page 2-16

are the delimiter values used throughout the entire message. In the absence of other considerations, HL7 recommends the suggested values found in Figure 2-1 delimiter values.

At any given site, the subset of the possible delimiters may be limited by negotiations between applications. This implies that the receiving applications will use the agreed upon delimiters, as they appear in the Message Header segment (MSH), to parse the message.

Delimiter	Suggested Value	Encoding Character Position	Usage
Segment Terminator	<cr> (hex 0D)</cr>	-	Terminates a segment record. This value cannot be changed by implementors.
Field Separator		-	Separates two adjacent data fields within a segment. It also separates the segment ID from the first data field in each segment.
Component Separator	٨	1	Separates adjacent components of data fields where allowed.
Subcomponent Separator	&	4	Separates adjacent subcomponents of data fields where allowed. If there are no subcomponents, this character may be omitted.
Repetition Separator	~	2	Separates multiple occurrences of a field where allowed.
Escape Character		3	Escape character for use with any field represented by an ST, TX or FT data type, or for use with the data (fourth) component of the ED data type. If no escape characters are used in a message, this character may be omitted. However, it must be present if subcomponents are used in the message.

Figure 2-1. Delimiter values

2.9 DATA TYPES

The data types in this section are listed in alphabetical order.

Note: For data types which contain multiple components or subcomponents, the examples given in this section do not specify the optionality of the component or subcomponents. This must be specified in the field definitions that follow the formal segment attribute tables.

Except for the TS data type and the maximum or minimum lengths for several other data types (CE, PN, TX, FT), the field length of HL7 attributes is specified in the segment attribute tables, and any specific length of the components or subcomponents of those attributes must be specified in the field definitions that follow the formal segment attribute tables. In general, HL7 does not specify the lengths of components and/or subcomponents.

(The data type examples in this Standard are given using the standard HL7 encoding rules, with the delimiter values from Figure 2-1 of Section 2.8, "MESSAGE DELIMITERS." Although only one set of encoding rules is defined as a standard in HL7 Version 2.4, other encoding rules are possible (but since they are non-standard, they may only be used by a site-specific agreement).

In certain data type definitions, square brackets, "[" and "]", are used to specify optional parts of a data type (or of a data type component or subcomponent).

The following table lists the data types by category. An alpha listing of the data types is also available. See <u>*HL7*</u> <u>*Table 0440*</u>.

* for subcomponents of these elements please refer to the definition in the text.

2.9.1 AD - address

Components: <street address (ST)> ^ < other designation (ST)> ^ <city (ST)> ^ <state or province (ST)> ^ <zip or postal code (ST)> ^ <country (ID)> ^ <address type (ID)> ^ <other geographic designation (ST)>

Note: Replaced by the XAD data type as of v 2.3.

Example:

|10 ASH LN^#3^LIMA^0H^48132|

2.9.1.1 Street address (ST)

The street or mailing address of a person or institution. When referencing an institution, this first component is used to specify the institution name. When used in connection with a person, this component specifies the first line of the address.

2.9.1.2 Other designation (ST)

Second line of address. In general, it qualifies address. Examples: Suite 555 or Fourth Floor. When referencing an institution, this component specifies the street address.

- 2.9.1.3 City (ST)
- 2.9.1.4 State or province (ST)

State or province should be represented by the official postal service codes for that country.

2.9.1.5 Zip or postal code (ST)

Zip or postal codes should be represented by the official codes for that country. In the US, the zip code takes the form 99999[-9999], while the Canadian postal code takes the form A9A9A9.

2.9.1.6 Country (ID)

Defines the country of the address. ISO 3166 provides a list of country codes that may be used.¹ This ISO table has three separate forms of the country code: HL7 specifies that the 3-character (alphabetic) form be used for the country code. Refer to <u>HL7 Table 0399 – Country code</u> for valid values.

2.9.1.7 Address type (ID)

Type is optional and defined by <u>HL7 Table 0190 - Address type</u>.

Value	Description
BA	Bad address
N	Birth (nee) (birth address, not otherwise specified)
BDL	Birth delivery location (address where birth occurred)
F	Country Of Origin
С	Current Or Temporary
В	Firm/Business
н	Home
L	Legal Address
М	Mailing
0	Office
Р	Permanent
RH	Registry home. Refers to the information system, typically managed by a public health agency, that stores patient information such as immunization histories or cancer data, regardless of where the patient obtains services.
BR	Residence at birth (home address at time of birth)

HL7 Table 0190 - Address type

2.9.1.8 Other geographic designation (ST)

Other geographic designation includes county, bioregion, SMSA, etc.

2.9.2 CD - channel definition

Components: <channel identifier (CM)> ^ <waveform source (CM)> ^ <channel sensitivity/units (CM)> ^ <channel calibration parameters (CM)> ^ <sampling frequency (NM)> ^ <minimum/maximum data values (CM)>

This data type is used for labeling of digital waveform data. See Chapter 7, Section 7.16.2, "CD - channel definition," for a complete description of this data type.

2.9.3 CE - coded element

Components: <identifier (ST)> ^ <text (ST)> ^ <name of coding system (IS)> ^ <alternate identifier (ST)> ^ <alternate text (ST)> ^ <name of alternate coding system (IS)>

Length: 250

¹ Available from ISO 1 Rue de Varembe, Case Postale 56, CH 1211, Geneva, Switzerland.

This data type transmits codes and the text associated with the code.

Example:

|F-11380^CREATI NI NE^I 9^2148-5^CREATI NI NE^LN|

2.9.3.1 Identifier (ST)

Sequence of characters (the code) that uniquely identifies the item being referenced by the <text>. Different coding schemes will have different elements here.

2.9.3.2 Text (ST)

Name or description of the item in question. E.g., myocardial infarction or X-ray impression. Its data type is string (ST).

2.9.3.3 Name of coding system (IS)

Each coding system is assigned a unique identifier. This component will serve to identify the coding scheme being used in the identifier component. The combination of the **identifier** and **name of coding system** components will be a unique code for a data item. Each system has a unique identifier.

<u>User-defined Table 0396 – Coding system</u> contains the allowable values. The table includes ASTM E1238-94, Diagnostic, procedure, observation, drug ID, and health outcomes coding systems as identified in the tables in Section 7.1.4, "Coding schemes." Others may be added as needed.

Some organizations that publish code sets author more than one. The coding system, then, to be unique is a concatenation of the name of the coding authority organization and the name of its code set or table. When an HL7 table is used for a CE data type, the *name of coding system* component is defined as *HL7nnnn* where *nnnn* is the HL7 table number. Similarly, ISO tables will be named ISOnnnn, where nnnn is the ISO table number.

2.9.3.4 Alternate identifier (ST)

For explanation, see text after 2.8.3.6.

2.9.3.5 Alternate text (ST)

For explanation, see text after 2.8.3.6.

2.9.3.6 Name of alternate coding system (IS)

Note on the Alternate components (4, 5, 6) (for components 1, 2, 3)

These three components are defined analogously to the above for the alternate or local coding system. If the *alternate text* component is absent, and the alternate identifier is present, the *alternate text* will be taken to be the same as the *text* component. If the *alternate coding system* component is absent, it will be taken to mean the locally-defined system.

Note: The presence of two sets of equivalent codes in this data type is semantically different from a repetition of a CE-type field. With repetition, several distinct codes (with distinct meanings) may be transmitted.

Refer to <u>User-defined table 0396</u> Coding Systems for valid values. When an HL7 table is used for a CE data type, the *name of coding system* component is defined as *HL7nnnn* where *nnnn* is the HL7 table number. Guidelines for the diagnostic, procedure, observation, drug, and health outcomes coding systems use are presented in Chapter 7.

Health Level Seven, Version 2.4 © 2000. All rights reserved.

2.9.4 CF - coded element with formatted values

This data type transmits codes and the formatted text associated with the code. This data type can be used to transmit for the first time the formatted text for the **canned text** portion of a report, for example, a standard radiologic description for a normal chest X-ray. The receiving system can store this information and in subsequent messages only the identifier need be sent. Another potential use of this data type is transmitting master file records that contain formatted text. This data type has six components as follows:

Components: <identifier (ID)> ^ <formatted text (FT)> ^ <name of coding system (IS)> ^ <alternate identifier (ID)> ^ <alternate formatted text (FT)> ^ <name of alternate coding system (IS)>

The components, primary and alternate, are defined exactly as in the CE data type with the exception of the second and fifth components, which are of the formatted text data type. Example:

```
0BX||CF|71020^{CXR^CPMC}||79989^{H}. Description: \N\. sp\ti+4\Heart\ is\ not\ enlarged. There is no evidence of pneumonia, effusion, pneumothorax or any masses. \. sp+3\H\Impression: \N\. sp\ti+4\Negative\ chest. ^CPMC
```

2.9.5 CK - composite ID with check digit

 $\label{eq:components: (ID number (NM)> ^ <check digit (NM)> ^ <code identifying the check digit scheme employed (ID)> ^ < assigning authority (HD)>$

Length: 250

This data type is used only in *CDM-11-Contract number* as defined in chapter 8, section 8.10.2.11. If a site is not using check digits for a particular CK field, the second and third components are not valued. Example:

|128952^6^M11^ADT01|

2.9.5.1 ID number (NM)

2.9.5.2 Check digit (NM)

The check digit in this data type is <u>not</u> an add-on produced by the message processor. It is the check digit that is part of the identifying number used in the sending application. If the sending application does not include a self-generated check digit in the identifying number, this component should be valued null.

2.9.5.3 Code identifying the check digit scheme employed (ID)

The check digit scheme codes are defined in <u>HL7 Table 0061 - Check digit scheme</u>.

Value	Description
NPI	Check digit algorithm in the US National Provider Identifier
ISO	ISO 7064: 1983
M10	Mod 10 algorithm
M11	Mod 11 algorithm

HL7 Table 0061 - Check digit scheme

The algorithm for calculating a Mod10 check digit is as follows:

Assume you have an identifier = 12345. Take the odd digit positions, counting from the right, i.e., 531, multiply this number by 2 to get 1062. Take the even digit positions, starting from the right (i.e., 42), prepend these to the 1062 to get 421062. Add all of these six digits together to get 15. Subtract this number

from the next highest multiple of 10, i.e., 20 - 15 to get 5. The Mod10 check digit is 5. The Mod10 check digit for 401 is 0; for 9999, it's 4; for 99999999, it's 8.

The algorithm for calculating a Mod11 check digit is as follows:

Terms

- d = digit of number starting from units digit, followed by 10's position, followed by 100's position, etc.
- w = weight of digit position starting with the units position, followed by 10's position, followed by 100's position etc. Values for w = 2, 3, 4, 5, 6, 7, 2, 3, 4, 5, 6, 7, etc. (repeats for each group of 6 digits)

c = check digit

Calculation

(Step 1) m	=	sum of (d * w) for positions 1, 2, etc. starting with units digit
		for d = digit value starting with units position to highest order
		for w = weight value from 2 to 7 for every six positions starting with units digit
(Step 2) c1	=	m mod 11
(Step 3) if c1	=	0 then reset $c1 = 1$
(Step 4)	=	(11 - c1) mod 10

Example:

if the number is 1234567, then the mod 11 check digit = 4

The calculations are:

M = (7*2) + (6*3) + (5*4) + (4*5) + (3*6) + (2*7) + (1*2)= 14 + 18 + 20 + 20 + 18 + 14 + 2 = 106 c1 = 106 mod 11 = 7 c = (11-c1) mod 10 = 4 mod 10 = 4

Other variants of these check digit algorithms exist and may be used by local bilateral site agreement.

2.9.5.4 Assigning authority (HD)

The assigning authority is a unique identifier of the system (or organization or agency or department) that creates the data. It is a HD data type. Assigning authorities are unique across a given HL7 implementation. *User-defined Table 0363 – Assigning authority* is used as the HL7 identifier for the user-defined table of values for the first sub-component, namespace ID.

Health Level Seven, Version 2.4 © 2000. All rights reserved.

Value	Description
AUSDVA	Australia - Dept. of Veterans Affairs
AUSHIC	Australia - Health Insurance Commission
CANAB	Canada - Alberta
CANBC	Canada - British Columbia
CANMB	Canada - Manitoba
CANNB	Canada - New Brunswick
CANNF	Canada - Newfoundland
CANNS	Canada - Nova Scotia
CANNT	Canada - Northwest Territories
CANNU	Canada - Nanavut
CANON	Canada - Ontario
CANPE	Canada - Prince Edward Island
CANQC	Canada - Quebec
CANSK	Canada - Saskatchewan
CANYT	Canada - Yukon Territories
NLVWS	NL - Ministerie van Volksgezondheid, Welzijn en Sport
USCDC	US Center for Disease Control
USHCFA	US Healthcare Finance Authority
USSSA	US Social Security Administration

User-defined Table 0363 - Assigning authority

Note: When the HD data type is used in a given segment as a component of a field of another data type, <u>User-defined</u> <u>Table 0300 - Namespace ID</u> (referenced by the first sub-component of the HD component) may be redefined (given a different user-defined table number and name) by the technical committee responsible for that segment.

By site agreement, implementors may continue to use <u>User-defined Table 0300 – Namespace ID</u> for the first sub-component.

2.9.6 CM - composite

A field that is a combination of other meaningful data fields. Each portion is called a **component**. The specific components of CM fields are defined within the field descriptions. Certain other composites have been separately identified and are described below.

No new CMs are allowed after HL7 version 2.2. *The CM data type is maintained strictly for backward compatibility and may not be used for the definition of new fields.*

Wherever a component of an HL7 field is itself an HL7 data type which contains components, its delimiters are demoted by one. Thus a component designated as a CE data type should be encoded as <identifier & text & name of coding system> (see Section 2.9.3, "CE - coded element"). Note that since HL7 delimiters are not recursive, an HL7 data type containing components cannot be a subcomponent. When this level of detail is needed, each component of the HL7 data type can be encoded as a separate subcom-

ponent. For an example of this, see the encoding of the filler order number in the order sequencing component of the Timing/Quantity data type.

2.9.7 CN - composite ID number and name

Components: <ID number (ST)> ^ <family name (FN)> ^ <given name (ST)> ^ < second and further given names or initials thereof (ST)> ^ <suffix (e.g., JR or III) (ST)> ^ <prefix (e.g., DR) (ST)> ^ <degree (e.g., MD) (IS)> ^ <source table (IS)> ^ <assigning authority (HD)>
Subcomponents of family name: <surname (ST)> ^ <own surname prefix (ST)> ^ <own surname (ST)> ^ <surname prefix from partner/spouse (ST)> ^ <surname from partner/spouse (ST)>

Note: Replaced by XCN data type as of v. 2.3.

Length: 250

This data type is used when identifying a person both as a coded value and with a text name. For specific fields, individual sites may elect to omit the ID or the name. Example:

```
| 12372^RI GGI NS^JOHN^""^""^MD^ADT1 |
| 12372^^^^^AADT1 |
| ^RI GGI NS^JOHN^""^""^""^MD |
```

2.9.7.1 ID number (ST)

Coded ID according to a user-defined table, defined by the 8th component. If the first component is present, either the source table or the assigning authority must be valued.

2.9.7.2 Family name (FN)

This component allows full specification of the surname of a person. Where appropriate, it differentiates the person's own surname from that of the person's partner or spouse, in cases where the person's name may contain elements from either name. It also permits messages to distinguish the surname prefix (such as "van" or "de") from the surname root. See section 2.9.19, "FN - family name".

2.9.7.3 Given name (ST)

First name.

- 2.9.7.4 second and further given names or initials thereof (ST)
- 2.9.7.5 Suffix (ST)

Used to specify a name suffix (e.g., Jr. or III).

2.9.7.6 Prefix (ST)

Used to specify a name prefix (e.g., Dr.).

2.9.7.7 Degree (IS)

Used to specify an educational degree (e.g., MD). Refer to *User-defined Table 0360 – Degree* for suggested values.

Health Level Seven, Version 2.4 © 2000. All rights reserved.

2.9.7.8 Source table (IS)

<u>User-defined Table 0297 - CN ID source</u> is used as the HL7 identifier for the user-defined table of values for this component. Used to delineate the first component.

User-defined Table	0.0297 -	CN ID source
User-uermeu rabie	- 1221 -	CIVID Source

Value	Description
	No suggested values defined

2.9.7.9 Assigning authority (HD)

The assigning authority is a unique identifier of the system (organization or agency or department) that creates the data. It is a HD data type. *User-defined Table 0363 – Assigning authority* is used as the HL7 identifier for the user-defined table of values for the first sub-component of the HD data type, *namespace ID*.

Note: When the HD data type is used in a given segment as a component of a field of another data type, <u>User-defined</u> <u>Table 0300 - Namespace ID</u>, (referenced by the first sub-component of the HD component) may be redefined (given a different user-defined table number and name) by the technical committee responsible for that segment.

By site agreement, implementors may continue to use <u>User-defined Table 0300 – Namespace ID</u> for the first sub-component.

2.9.8 CNE – coded with no exceptions

```
Components: <identifier (ST)> ^ <text (ST)> ^ <name of coding system (IS)> ^ <alternate identifier (ST)> ^ <alternate text (ST)> ^ <name of alternate coding system (IS)> ^ <coding system version ID (ST)> ^ alternate coding system version ID (ST)> ^ <original text (ST)>
```

Length: 250

2.9.8.1 Identifier (ST)

Sequence of characters (the code) that uniquely identifies the item being referenced by the <text>. Different coding schemes will have different elements here.

2.9.8.2 Text (ST)

Name or description of the item in question. E.g., myocardial infarction or X-ray impression. Its data type is string (ST). This is the corresponding text assigned by the coding system to the identifier.

2.9.8.3 Name of coding system (IS)

Each coding system is assigned a unique identifier. This component will serve to identify the coding scheme being used in the identifier component. The combination of the **identifier** and **name of coding system** components will be a unique code for a data item. Each system has a unique identifier.

<u>User-defined Table 0396 – Coding system</u> contains the allowable values. The table includes ASTM E1238-94, Diagnostic, procedure, observation, drug ID, and health outcomes coding systems as identified in the tables in Section 7.2.5, "Coding schemes." Others may be added as needed.

Some organizations that publish code sets author more than one. The coding system, then, to be unique is a concatenation of the name of the coding authority organization and the name of its code set or table. When an HL7 table is used for a CE data type, the *name of coding system* component is defined as *HL7nnnn* where *nnnn* is the HL7 table number. Similarly, ISO tables will be named ISOnnnn, where nnnn is the ISO table number.

Page 2-30

2.9.8.4 Alternate identifier (ST)

Analogous to "Identifier" above. See 2.9.8.10, "Usage notes:" for further description.

2.9.8.5 Alternate text (ST)

Analogous to "Text" above. See 2.9.8.10, "Usage notes:" for further description.

2.9.8.6 Name of alternate coding system (IS)

Analogous to "Name of Coding System" above. See 2.9.8.10, "Usage notes:" for further description.

2.9.8.7 Coding system version ID (ST)

This is the version ID for the coding system identified by component 1-3. It belongs conceptually to components 1-3 and appears here only for reasons of backward compatibility.

2.9.8.8 Alternate coding system version ID (ST)

This is the version ID for the coding system identified by components 4-6. It belongs conceptually to the group of Alternate components (see note 2.9.3.6) and appears here only for reasons of backward compatibility.

2.9.8.9 Original text (ST)

The original text that was available to an automated process or a human before a specific code was assigned. This component is optional.

2.9.8.10 Usage notes:

Components 1-3 and 7: The *identifier* is required and must be a valid code. *Coding system* must either be present and have a value from the set of allowed coding systems or if not present it will be interpreted to have the same meaning as if it had been valued with the code meaning "HL7 coding system." <u>User-defined</u> <u>Table 0396 – Coding system</u> contains the allowable values. If the coding system is any system other than "HL7 coding system," version ID must be valued with an actual version ID. If the coding system is "HL7 coding system," version ID may have an actual value or it may be absent. If version ID is absent, it will be interpreted to have the same value as the HL7 version number in the message header. Text description of code is optional but its use should be encouraged since it makes messages easier to review for accuracy, especially during interface testing and debugging.

Component 9: This is the original text that was available to an automated process or a human before a specific code was assigned. This component is optional.

Components 3-6 and 8: These components are optional. They are used to represent the local or user seen code as described. If present, components 3-6 and 8 obey the same rules of use and interpretation as described for components 1-3 and 7. If both are present, the identifiers in component 4 and component 1 should have exactly the same meaning, i.e., they should be exact synonyms.

CNE usage note: The CNE data type should be used when a required or mandatory coded field is needed.

<u>User-defined Table 0396 – Coding system</u> contains the allowable values. The table includes ASTM E1238-94, diagnostic, procedure, observation, drug and health outcomes coding systems. When an HL7 table is used for a CE data type, the *name of coding system* component is defined as *HL7nnnn* where *nnnn* is the HL7 table number. Guidelines for their use are presented in Chapter 7, Section 7.1, "Introduction and Overview."

Health Level Seven, Version 2.4 © 2000. All rights reserved.

Examples:

1. If the Value Type field (sequence 2) of the OBX segment was defined to be of type CNE, and the desired *value type* was a number, the shortest representation of the *value type* field would be identical to the current ID field syntax:

0BX | 1 | NM| 718- 7^Hemogl obi n^LN | | 13. 4 | GM/DL | 14- 18 | N | | S | F<cr>

A more verbose representation of the same OBX segment that included *text* would be:

 $0BX \,|\, 1 \,|\, \text{NM^Numeri} \, c \,|\, 718 \text{--} \, 7^{\text{-}} \text{Hemogl} \, obi \, n^{\text{-}} \text{LN} \,|\, |\, 13. \, 4 \,|\, \text{GM/DL} \,|\, 14 \text{--} \, 18 \,|\, \text{N} \,|\, |\, \text{S} \,|\, \text{F}{<} \text{cr}{>}$

An even more verbose representation of the same OBX segment that included *text* and *coding system* would be:

 $0BX\,|\,1\,|\,NM^{*}Numer\,i\,c^{*}HL70125\,|\,718-\,7^{*}Hemog\,l\,obi\,n^{*}LN\,|\,|\,13.\,4\,|\,GM^{\prime}DL\,|\,14-\,18\,|\,N\,|\,\,|\,S\,|\,F<\!cr>$

To retain the information about the code used in the original system that created the data, alternative coding scheme data could be included:

0BX | 1 | NM^Numeri c^HL70125^NUM^Number^99LAB | 718-7^Hemogl obi n^LN | 13.4 | GM/DL | 14-18 | N | | S | F<cr>

If in addition to the above, one wanted to capture the version of vocabulary being used, and the HL7 version was "2.3.1", and the 99LAB coding scheme version was "1.1", the field would appear as:

```
0BX \mid 1 \mid NM^{Numeri} c^{HL70125^{NUM^{Number^{99LAB^{2}. 3. 1^{1. 1}} + 178-7^{Hemogl} obi n^{LN} \mid 13. 4 \mid GM/DL \mid 14-18 \mid N \mid \mid S \mid F < cr>
```

Furthermore, if one wanted to include the "user seen" text of the value format, and the user had seen "Decimal" as the field type on a data entry screen, the field would appear as:

 $0BX \mid 1 \mid NM^{Numeri} c^{HL70125^{NUM^{Number^{99LAB^{2. 3. 1^{1. 1^{Deci mal}} \mid 718-7^{Hemogl obi n^{LN} \mid 13. 4 \mid GM/DL \mid 14-18 \mid N \mid \mid S \mid F < cr>$

Finally, a user could use the abbreviated form for the primary identifier, and use the long form for the alternative identifier.

2. If the *value type* field had been defined as a CNE field, and if the desired *value type* was not in the value set, <u>a valid OBX instance could not be created</u>. For example, if a laboratory system had an internal value type of "Decimal Range", since there is no corresponding *value type* available in HL7 table 0125, no valid OBX instance could be created. The following instance would be incorrect. In all valid instances of CNE fields, the identifier field <u>must</u> have a valid value from the specified table.

Incorrect (no valid identifier)

 $0BX|1|^{\wedge\wedge}DR^{Decimal} \ Range \\ ^{99LAB^{\wedge}1. \ 1^{Decimal}} \ Range \\ |718-7^{Hemoglobin^{LN}}||13.4|GM^{\prime}DL||14-18|N||S|F \\ < cr>$

3. If the *coding scheme* is anything other than an HL7 table identifier, the coding scheme must be a valid scheme from the coding schemes specified in Chapter 7. For example, if the *Observation Identifier* field (sequence 3) of the OBX segment was typed as a CNE field, and LOINC version 1.0k was being used as the source of values for *Observation Identifier*, then the following OBX instance would be valid:

0BX | 1 | NM| 718- 7^Hemogl obi n^LN^^^1. 0k | | 13. 4 | GM/DL | 14- 18 | N | | S | F<cr>

However, the following OBX instance would be incorrect, since the coding scheme designation "LOCAL" is not in the list of valid coding scheme identifiers, nor does it conform to the rules described in Chapter 7 for creating valid "local" coding scheme identifiers.

Incorrect (invalid coding scheme)

0BX | 1 | NM | 9587- 2^Hemogl obi n^L0CAL^^^1. 0k | 13. 4 | GM/DL | 14- 18 | N | | S | F<cr>

A valid OBX instance using a local coding scheme "99LAB" would be allowed, since "99LAB" conforms to the rules for identifying local coding schemes as described in Chapter 7. The valid OBX instance would be represented as follows:

 $0BX \,|\, 1 \,|\, NM| \,9587 \text{-} \, 2^{\text{-}} Hemogl \, obi \, n^{\text{-}} 99LAB^{\text{-} \wedge \wedge \wedge} 6. \, 5 \,|\, |\, 13. \, 4 \,|\, GM/DL \,|\, 14 \text{-} \, 18 \,|\, N \,|\, |\, S \,|\, F < \! cr > \, Cr >$

Finally, if the coding scheme is anything other than an HL7 table identifier, a version number must be present. The following OBX instance is incorrect because it is missing a valid version number even though the coding scheme LN (LOINC) is valid:

Incorrect (missing version number)

0BX | 1 | NM| 718- 7^Hemogl obi n^LN | | 13. 4 | GM/DL | 14- 18 | N | | S | F<cr>

2.9.9 CP - composite price

 $\label{eq:components: components: <price (MO)> ^ <price type (ID)> ^ <from value (NM)> ^ <to value (NM)> ^ <range units (CE)> ^ <range type (ID)> \\$

Subcomponents of price: <quantity (NM)> & <denomination (ID)>

Note: This data type is often used to define a repeating field within a given segment.

Note: Replaces MO as of v 2.3.

Example:

| 100. 00&USD^UP^0^9^mi n^P~50. 00&USD^UP^10^59^mi n^P~10. 00&USD^UP^60^999^P~50. 00&USD^AP~ 200. 00&USD^PF

~80. 00&USD^DC|

2.9.9.1 Price (MO)

The only required component; usually containing a decimal point. Note that each component of the MO data type (Section 2.9.26, "MO - money") is a subcomponent here.

2.9.9.2 Price type (ID)

A coded value, data type ID. Refer to HL7 Table 0205 - Price type for valid values.

Value	Description
AP	administrative price or handling fee
DC	direct unit cost
IC	indirect unit cost
PF	professional fee for performing provider
TF	technology fee for use of equipment
TP	total price
UP	unit price, may be based on length of procedure or service

HL7 Table 0205 - Price type

Health Level Seven, Version 2.4 © 2000. All rights reserved.

2.9.9.3 From value (NM)

Each is a NM data type; together they specify the "range." The range can be defined as either time or quantity. For example, the range can indicate that the first 10 minutes of the procedure has one price. Another repetition of the data type can use the range to specify that the following 10 to 60 minutes of the procedure is charged at another price per; a final repetition can specify that the final 60 to N minutes of the procedure at a third price.

Note that, if the <price type> component is TP, both <from value> and <to value> may be null.

2.9.9.4 To value (NM)

See <from value> above.

2.9.9.5 Range units (CE)

A coded value, data type CE, defined by the standard table of units for either time or quantity (see for example, the tables in Section 7.1.4, "Coding schemes"). This describes the units associated with the range, e.g., seconds, minutes, hours, days, quantity (*i.e.*, count); it is required if <from value> and <to value> are present.

2.9.9.6 Range type (ID)

Refers to HL7 Table 0298 - CP range type for valid values.

HL7 Table 0298 - CP range type

Value	Description
Р	Pro-rate. Apply this price to this interval, pro-rated by whatever portion of the interval has oc- curred/been consumed
F	Flat-rate. Apply the entire price to this interval, do not pro-rate the price if the full interval has not occurred/been consumed

2.9.10 CQ - composite quantity with units

Components: <quantity (NM)> ^ <units (CE)>

Note: In future versions, CQ fields should be avoided because the same data can usually be sent as two separate fields, one with the value and one with the units as a CE data type.

Examples:

|123.7^kg| kilograms is an ISO unit

|150^lb&&ANSI+| weight in pounds is a customary US unit defined within ANSI+.

2.9.10.1 Quantity (NM)

2.9.10.2 Units (CE)

The units in which the quantity is expressed. Field-by-field, default units may be defined within the specifications. When the observation is measured in the default units, the units need not be transmitted. If the measure is recorded in units different from the default, the measurement units must be transmitted as the second component. If the units are ISO+ units, then units should be recorded as lowercase abbreviations as specified in Chapter 7. If the units are ANSI or local, the units and the source table must be recorded as specified in Chapter 7. But in these cases the component separator should be replaced by the subcomponent delimiter

```
Subcomponents for units: <identifier (ST)> & <text (ST)> & <name of coding system (IS)> & <alter-
nate identifier (ST)> & <alternate text (ST)> & <name of alternate coding system
(IS)>
```

2.9.11 CWE – coded with exceptions

```
Components: <identifier (ST)> ^ <text (ST)> ^ <name of coding system (IS)> ^ <alternate identifier
(ST)> ^ <alternate text (ST)> ^ <name of alternate coding system (IS)> ^ <coding sys-
tem version ID (ST)> ^ alternate coding system version ID (ST)> ^ <original text
(ST)>
```

Length: 250

2.9.11.1 Identifier (ST)

Sequence of characters (the code) that uniquely identifies the item being referenced by the <text>. Different coding schemes will have different elements here.

2.9.11.2 Text (ST)

Name or description of the item in question. E.g., myocardial infarction or X-ray impression.

2.9.11.3 Name of coding system (IS)

Each coding system is assigned a unique identifier. This component will serve to identify the coding scheme being used in the identifier component. The combination of the **identifier** and **name of coding system** components will be a unique code for a data item. Each system has a unique identifier.

<u>User-defined Table 0396 – Coding system</u> contains the allowable values. The table includes ASTM E1238-94, Diagnostic, procedure, observation, drug ID, and health outcomes coding systems as identified in the tables in Section 7.1.4, "Coding schemes." Others may be added as needed.

Some organizations that publish code sets author more than one. The coding system, then, to be unique is a concatenation of the name of the coding authority organization and the name of its code set or table. When an HL7 table is used for a CE data type, the *name of coding system* component is defined as *HL7nnnn* where *nnnn* is the HL7 table number. Similarly, ISO tables will be named ISOnnnn, where nnnn is the ISO table number.

2.9.11.4 Alternate identifier (ST)

Analogous to "Identifier" above. See 2.9.11.10, "Usage notes:" for further description.

2.9.11.5 Alternate text (ST)

Analogous to "Text" above. See 2.9.11.10, "Usage notes:" for further description.

2.9.11.6 Name of alternate coding system (IS)

Analogous to "Name of Coding System" above. See 2.9.11.10, "Usage notes:" for further description.

2.9.11.7 Coding system version ID (ST)

This is the version ID for the coding system identified by components 1-3. It belongs conceptually to the group of component 1-3 and appears here only for reasons of backward compatibility.

2.9.11.8 Alternate coding system version ID (ST)

This is the version ID for the coding system identified by components 4-6. It belongs conceptually to the group of alternate components (see note 0, "Analogous to "Text" above. See 2.9.11.10, "Usage notes:" for further description.

Name of alternate coding system (IS)") and appears here only for reasons of backward compatibility.

2.9.11.9 Original text (ST)

The original text that was available to an automated process or a human before a specific code was assigned

2.9.11.10 Usage notes:

This is a field that is generally sent using a code, but where the code may be omitted in exceptional instances or by site agreement. Exceptional instances arise when the coding system being used does not have a code to describe the concept in the text.

Components 1-3 & 7 are used in one of three ways:

Coded: The identifier contains a valid code from a coding system. The coding system must either be
present and have a value from the set of allowed coding systems, or if not present, it will be interpreted
to have the same meaning as if it had been valued with the code meaning "HL7 coding system." <u>Userdefined Table 0396 – Coding system</u> contains the allowable values. The table includes ASTM E123894, Diagnostic, procedure, observation, drug ID, and health outcomes coding systems as identified in
the tables in Section 7.1.4, "Coding schemes." If the coding system is any system other than "HL7
coding system", version ID must be valued with an actual version ID. If the coding system is "HL7
coding system," version ID may have an actual value or it may be absent. If version ID is absent, it
will be interpreted to have the same value as the HL7 version number in the message header. Text description is optional, but its use should be encouraged to aid in readability of the message during testing
and debugging.

Example 1a: OBX segment where the observation identifier is a LOINC code and the observation value is being sent as a CWE value, and the value is taken from SNOMED International.

0BX | 1 | CWE | 883-9^AB0 Group^LN | 1 | F-D1250^Type 0^SNM3^^^3. 4 | | | N | | F<cr>

Example 1b: OBX segment where the observation identifier is a LOINC code and the observation value is being sent as an CWE value, and the value is taken from a (currently hypothetical) HL7 table.

2) **Uncoded:** Text is valued, the identifier has no value, and coding system and version ID follow the same rules as discussed for option 1.

Example 2: OBX segment where the observation identifier is a LOINC code and the observation value is being sent as an CWE value, and the value is sent as text because the correct clinical value, "Wesnerian" was not found in the set of allowed values.

0BX | 1 | CWE | 883-9^AB0 Group^LN | 1 | ^Wesneri an^SNMB^^^3. 4 | | | A | | F<cr>

3) **Data missing:** The name of the coding system is "HL7 CE Status," version ID is either a real version, or if not present it has the same meaning as the version in the message header, and the identifier takes its value from one of the allowed CE field statuses. The codes for the allowed CE field statuses are shown below and will be maintained in a table as part of the HL7 vocabulary. Text description of code is optional.

Example 3: OBX segment where the observation identifier is a LOINC code and the observation value is being sent as an LCE value, and no value can be sent because the test was not done.

OBX | 1 | CWE | 883-9^AB0 Group^LN | 1 | NAV^Not Available^HL70353^^^2. 3. 1 | | | N | | F<cr>

Component 9:

This is the original text that was available to an automated process or a human before a specific code was assigned. This field is optional.

Components 3-6 & 8:

Components 3-6 & 8 are optional. They are used to represent the local or user seen code. If present, components 3-6 & 8 obey the same rules of use and interpretation as described for components 1-3 & 7 (of the CWE data type). If both are present, the identifiers in component 4 and component 1 should have exactly the same meaning; i.e. they should be exact synonyms.

Example 4: OBX segment where the observation identifier is a LOINC code and the observation value is being sent as an CWE value, and the value is taken from SNOMED International. The user seen fields are being used to represent a local coding system (99LAB) used in the sending system.

0BX|1|CWE|883-9^AB0 Group^LN|1|F-D1250^Type 0^SNM3^0^0 Type Blood^99LAB^3.4^|||||F<cr>

Summary of CWE usage notes with table of status values for various states without values:

The CWE data type should be used for coded fields that are optional or where it is permissible to send text for items that are not yet a part of the approved value set. In the normal situation, the identifier is valued with the code from the value set. If the value of the field is known, but is not part of the value set, then the value is sent as text, and the identifier has no value. If the field has an unknown status, then third form of the field is used (see **Data missing** above), and the appropriate status for the field is selected from the table of allowed statuses. When no code exists, use values from <u>HL7 Table 0353 – CWE statuses</u>

Code	Description
U	Unknown
UASK	Asked but Unknown
NAV	Not available
NA	Not applicable
NASK	Not asked

HL7 Table 0353 - CWE statuses

Where a text modifier might accompany a code, the "field" in the HL7 message would be of data type CWE and would be allowed to repeat. The first instance of the field would be used, as per option 1; i.e. the identifier would have a valid code. The second instance of the repeating field would be used, as per option 2, that is, the text description would take the value of the free text modifier.

2.9.12 CX - extended composite ID with check digit

Components: <ID (ST)> ^ <check digit (ST)> ^ <code identifying the check digit scheme employed (ID)> ^ < assigning authority (HD)> ^ <identifier type code (ID)> ^ < assigning facility (HD) ^ <effective date (DT)> ^ <expiration date (DT)>

Length: 250

Example:

|1234567^4^M11^ADT01^MR^University Hospital|

This data type is used for specifying an identifier with its associated administrative detail.

2.9.12.1 ID (ST)

Definition: The value of the identifier itself. It is similar to the CK data type (see Section 2.9.5, "CK - composite ID with check digit") except that a ST data type is used instead of a NM data type.

2.9.12.2 Check digit (ST)

Defined as in the CK data type (see Section 2.9.5, "CK - composite ID with check digit") except that an ST data type is allowed instead of an NM data type. The check digit in this data type is <u>not</u> an add-on produced by the message processor. It is the check digit that is part of the identifying number used in the sending application. If the sending application does not include a self-generated check digit in the identifying number, this component should be valued null.

2.9.12.3 Code identifying the check digit scheme employed (ID)

Defined as in the CK data type (see Section 2.9.5, "CK - composite ID with check digit"). Refer to *HL7 Table 0061- Check digit scheme* for valid values.

Note: The check digit and code identifying check digit scheme are null if ID is alphanumeric.

2.9.12.4 Assigning authority (HD)

The assigning authority is a unique name of the system (or organization or agency or department) that creates the data. It is a HD data type. *User-defined Table 0363 – Assigning authority* is used as the HL7 identifier for the user-defined table of values for the first sub-component of the HD component, <namespace ID>.

Note: When the HD data type is used in a given segment as a component of a field of another data type, <u>User-defined</u> <u>Table 0300 - Namespace ID</u> (referenced by the first sub-component of the HD component) may be re-defined (given a different user-defined table number and name) by the technical committee responsible for that segment.

By site agreement, implementors may continue to use <u>User-defined Table 0300 – Namespace ID</u> for the first sub-component.

2.9.12.5 Identifier type code (ID)

A code corresponding to the type of identifier. In some cases, this code may be used as a qualifier to the "Assigning authority" component. Refer to <u>*HL7 Table 0203 - Identifier type*</u> for suggested values.

Value	Description
AM	American Express
AN	Account number
BA	Bank Account Number
BR	Birth registry number
BRN	Breed Registry Number
DI	Diner's Club card
DL	Driver's license number
DN	Doctor number
DR	Donor Registration Number

HL7 Table 0203 - Identifier type

Value	Description
DS	Discover Card
EI	Employee number
EN	Employer number
FI	Facility ID
GI	Guarantor internal identifier
GN	Guarantor external identifier
HC	Health Card Number
JHN	Jurisdictional health number (Canada)
LN	License number
LR	Local Registry ID
MA	Medicaid number
MC	Medicare number
MCN	Microchip Number
MR	Medical record number
MS	MasterCard
NE	National employer identifier
NH	National Health Plan Identifier
NI	National unique individual identifier
NNxxx	National Person Identifier where the xxx is the ISO table 3166 3-character (alphabetic) country code
NPI	National provider identifier
PEN	Pension Number
PI	Patient internal identifier
PN	Person number
PRN	Provider number
PT	Patient external identifier
RR	Railroad Retirement number
RRI	Regional registry ID
SL	State license
SR	State registry ID
SS	Social Security number
U	Unspecified
UPIN	Medicare/HCFA's Universal Physician Identification numbers
VN	Visit number
VS	VISA
WC	WIC identifier
WCN	Workers' Comp Number

Value	Description
XX	Organization identifier

2.9.12.6 Assigning facility (HD)

Subcomponents: <namespace ID (IS)> & < universal ID (ST)> & <universal ID type (ID)>

Definition: The place or location identifier where the identifier was first assigned to the patient. This component is not an inherent part of the identifier but rather part of the history of the identifier: as part of this data type, its existence is a convenience for certain intercommunicating systems.

Note: When the HD data type is used in a given segment as a component of a field of another data type, <u>User-defined</u> <u>Table 0300 - Namespace ID</u> (referenced by the first sub-component of the HD component), may be re-defined (given a different user-defined table number and name) by the technical committee responsible for that segment.

2.9.12.7 Effective date (DT)

Definition: The first date, if known, on which the identifier is valid and active.

2.9.12.8 Expiration date (DT)

Definition: The last date, if known, on which the identifier is valid and active.

2.9.13 DLN - driver's license number

Components: <license number (ST)> ^ <issuing state, province, country (IS)> ^ <expiration date (DT)

Definition: This field contains the driver's license information. For state or province refer to official postal codes for that country; for country refer to ISO 3166 for codes.

2.9.13.1 Driver's license number (as ST data type)

This field contains the driver's license number.

2.9.13.2 Issuing state, province, country (IS)

Issuing authority for driver's license. For state or province refer to official postal codes for that country; for country refer to ISO 3166 for codes. (The ISO 3166 table has three separate forms of the country code: HL7 specifies that the 3-character (alphabetic) form be used for the country code.) <u>User-defined Table 0333</u> - <u>Driver's license issuing authority</u> is used as the HL7 identifier for the user-defined table of values for this component.

User-defined Table 0333 - Driver's license issuing authority

Value	Description
	No suggested values defined

2.9.13.3 Expiration date (DT)

Expiration date (DT) for driver's license.

2.9.14 DR - date/time range

Components: <range start date/time (TS)> ^ <range end date/time (TS)>

```
Subcomponents of range start date/time and range stop date/time:
	YYYY[MM[DD[HHMM[SS[.S[S[S]]]]]]][+/-ZZZZ] & <degree of precision>
```

2.9.14.1 Range start date/time (TS)

Definition: The first component contains the earliest date/time (time stamp) in the specified range.

2.9.14.2 Range end date/time (TS)

The second component contains the latest date/time in the specified range. Note that the TS (time stamp) data type allows the specification of precision.

2.9.15 DT - date

Format: YYYY[MM[DD]]

In prior versions of HL7, this data type was always specified to be in the format YYYYMMDD. In the current and future versions, the precision of a date may be expressed by limiting the number of digits used with the format specification YYYY[MM[DD]]. Thus, YYYY is used to specify a precision of "year," YYYYMM specifies a precision of "month," and YYYYMMDD specifies a precision of "day."

By site-specific agreement, YYYYMMDD may be used where backward compatibility must be maintained.

Examples:

|19880704| |199503|

2.9.16 ED - encapsulated data

```
Components: <source application (HD) > ^ <type of data (ID)> ^ <data subtype (ID)> ^ <encoding (ID)> ^ <data (ST)>
```

Subcomponents: <namespace ID (IS)> & < universal ID (ST)> & <universal ID type (ID)> $\ensuremath{\mathsf{N}}$

This data type transmits encapsulated data from a source system to a destination system. It contains the identity of the source system, the type of data, the encoding method of the data, and the data itself. This data type is similar to the RP (reference pointer) data type of Section 2.9.37, "RP - reference pointer," except that instead of pointing to the data on another system, it contains the data which is to be sent to that system.

2.9.16.1 Source application (HD)

A unique name that identifies the system which was the source of the data. Identical format and restrictions as in reference pointer (see Section 2.9.37.2, "Application ID (HD)").

2.9.16.2 Type of data (ID)

Identical to "type of data" component in the reference pointer (RP) data type. (See Section 2.9.37.3, "Type of data (ID)").

Refer to HL7 Table 0191 - Type of referenced data for valid values.

2.9.16.3 Data subtype (ID)

Identical to "subtype" component in the reference pointer (RP) data type. (See Section 2.9.37.4, "Subtype (ID)").

Refer to HL7 Table 0291 - Subtype of referenced data for valid values.

2.9.16.4 Encoding (ID)

The type of encoding, if present, used to represent successive octets of binary data as displayable ASCII characters. Refer to <u>HL7 Table 0299 - Encoding</u> for valid values.

Value	Description
A	No encoding - data are displayable ASCII characters.
Hex	Hexadecimal encoding - consecutive pairs of hexadecimal digits represent consecutive single octets.
Base64	Encoding as defined by MIME (Multipurpose Internet Mail Extensions) standard RFC 1521. Four consecutive ASCII characters represent three consecutive octets of binary data. Base64 utilizes a 65-character subset of US-ASCII, consisting of both the upper and lower case alphabetic characters, digits "0" through "9," "+," "/," and "=.".

Base64 is defined as follows (adapted from MIME Internet standard RFC 1521, which has precedence over this description). Proceeding from left to right across a 24-bit input group (three octets), each 6-bit group is used as an index into an array of 64 printable characters. The character referenced by the index is placed in the encoded string. These characters are shown in <u>HL7 Table 0290 - MIME base64 encoding characters</u>, and are selected so as to be universally representable.

Special processing is performed if fewer than 24 bits are available in an input group at the end of data. A full encoding quantum is always completed at the end of data. When fewer than 24 input bits are available in an input group, zero bits are added (on the right) to form an integral number of 6-bit groups.

Output character positions which are not required to represent actual input data are set to the character "=". Since all canonically encoded output is an integral number of octets, only the following cases can arise: (1) the final quantum of input is an integral multiple of 24 bits; here, the final unit of encoded output will be an integral multiple of 4 characters with no "=" padding, (2) the final quantum of input is exactly 8 bits; here, the final unit of encoded output will be two characters followed by two "="padding characters, or (3) the final quantum of input is exactly 16 bits; here, the final unit of encoded output will be three characters followed by one "=" padding character.

Value	Code	Value	Code	Value	Code	Value	Code
0	A	17	R	34	I	51	51 z
1	В	18	S	35	j	52	52 0
2	С	19	Т	36	k	53	53 1
3	D	20	U	37	I	54	54 2
4	E	21	V	38	m	55	55 3
5	F	22	W	39	n	56	56 4
6	G	23	Х	40	0	57	57 5
7	Н	24	Y	41	р	58	58 6
8	I	25	Z	42	q	59	59 7
9	J	26	а	43	r	60	60 8
10	K	27	b	44	S	61	61 9
11	L	28	С	45	t	62	62 +

HL7 Table 0290 - MIME base64 encoding characters

Value	Code	Value	Code	Value	Code	Value	Code
12	М	29	d	46	u	63	63 /
13	Ν	30	е	47	v		
14	0	31	f	48	w	(pad)	=
15	Р	32	g	49	х		
16	Q	33	h	50	У		

The interpretation of the encoded octets by any of the encoding methods, beyond what is either implicit or specified in the represented data type (such as their ordering within 16-bit or 32-bit binary words on the destination application), is determined by the destination application and is beyond the scope of this Standard.

2.9.16.5 Data (ST)

Displayable ASCII characters which constitute the data to be sent from source application to destination application. The characters are limited to the legal characters of the ST data type, as defined in Section 2.9.43, "ST - string data," and, if encoded binary, are encoded according to the method of Section 2.9.16.2, "Type of data (ID)."

If the encoding component (see Section 2.9.16.4, "Encoding (ID)") = 'A' (none), then the data component must be scanned before transmission for HL7 delimiter characters, and any found must be escaped by using the HL7 escape sequences defined in Section 2.10, "Use of escape sequences in text fields." On the receiving application, the data field must be de-escaped after being parsed.

If the encoding component (see Section 2.9.16.4, "Encoding (ID)") does not equal 'A,' then, after encoding, the (encoded) data must be scanned for HL7 delimiter characters, and any found must be escaped by using the HL7 escape sequences. Only then can the component be added to the HL7 segment/message. On the receiving application, the data field must be de-escaped after being parsed out of the message before being decoded. This can be expressed as 'encode', 'escape', parse, 'de-escape', 'decode'.

2.9.17 EI - entity identifier

Components: <entity identifier (ST)> ^ <namespace ID (IS)> ^ <universal ID (ST)> ^ < universal ID type (ID)>

The entity identifier defines a given entity within a specified series of identifiers.

The EI is appropriate for, but not limited to, machine or software generated identifiers. The generated identifier goes in the first component. The remaining components, 2 through 4, are known as the *assigning authority*; they identify the machine/system responsible for generating the identifier in component 1.

The specified series, the *assigning authority*, is defined by components 2 through 4. The assigning authority is of the hierarchic designator (HD) data type, but it is defined as three separate components in the EI data type, rather than as a single component as would normally be the case. This is in order to maintain backward compatibility with the EI's use as a component in several existing data fields. Otherwise, the components 2 through 4 are as defined in Section 2.9.21, "HD - hierarchic designator." Hierarchic designators (HD) are unique across a given HL7 implementation.

2.9.17.1 Entity identifier (ST)

The first component, <entity identifier>, is usually defined to be unique within the series of identifiers created by the <assigning authority>, defined by a hierarchic designator, represented by components 2 through 4. (See Section 2.9.21, "HD - hierarchic designator".)

Health Level Seven, Version 2.4 © 2000. All rights reserved.

2.9.17.2 Namespace ID (IS)

See Section 2.9.21.1, "Namespace ID (IS)" for definition.

The assigning authority is a unique identifier of the system (or organization or agency or department) that creates the data. <u>User-defined Table 0363 – Assigning authority</u> is used as the HL7 identifier for the user-defined table of values for this component.

Note: When the HD is used as a part of another data type, in this case as part of the EI data type, this table may be re-defined (given a different user-defined table number and name) by the technical committee responsible for that segment.

By site agreement, implementers may continue to use <u>User-defined Table 0300 – Namespace ID</u> for the first component

2.9.17.3 Universal ID (ST)

See Section 2.9.21.2, "Universal ID (ST)" for definition.

2.9.17.4 Universal ID type (ID)

Refer to <u>*HL7 Table 0301 - Universal ID type*</u> for valid values. See Section 2.9.21.3, "Universal ID type (ID)," for definition.

2.9.18 FC - financial class

Components: <financial class (IS)> ^ <effective date (TS)>

2.9.18.1 Financial class (IS)

This component contains the financial class assigned to a person. <u>User-defined Table 0064 - Financial class</u> is used as the HL7 identifier for the user-defined table of values for this component.

Value	Description
	No suggested values defined

2.9.18.2 Effective date (TS)

This component contains the effective date/time of the person's assignment to the financial class specified in the first component.

2.9.19 FN - family name

Components: <surname (ST)> ^ <own surname prefix (ST)> ^ <own surname (ST)> ^ <surname prefix from partner/spouse (ST)> ^ <surname from partner/spouse (ST)>

This data type allows full specification of the surname of a person. Where appropriate, it differentiates the person's own surname from that of the person's partner or spouse, in cases where the person's name may contain elements from either name. It also permits messages to distinguish the surname prefix (such as "van" or "de") from the surname root.

Note: Appears ONLY in the PN and other PN-containing data types (PPN, XCN, XPN).

2.9.19.1 Surname (ST)

The atomic element of the person's family name. In most Western usage, this is the person's last name.

2.9.19.2 Own surname prefix (ST)

Internationalization usage for Germanic languages. This component is optional. An example of a <surname prefix> is the "van" in "Ludwig van Beethoven." Since the <surname prefix> doesn't sort completely alphabetically, it is reasonable to specify it as a separate sub-component of the PN and extended PN data types (XPN and XCN).

Note: Subcomponents <own surname prefix>, <own surname>, <surname prefix from partner/spouse> and <surname from partner/spouse> decompose complex Germanic names such as "Irma de Jong-van Beethoven". If these subcomponents are valued, the <surname> subcomponent should still be fully valued for backward compatibility, i.e. ...^de Jong-van Beethoven&de&Jong&van&Beethoven^... Also, for clarity, the <last name prefix> has been renamed to <own surname prefix>.

2.9.19.3 Own surname (ST)

The portion of the surname (in most Western usage, the last name) that is derived from the person's own surname, as distinguished from any portion that is derived from the surname of the person's partner or spouse. This component is optional.

If the person's surname has legally changed to become (or incorporate) the surname of the person's partner or spouse, this is the person's surname immediately prior to such change. Often this is the person's "maiden name".

2.9.19.4 Surname prefix from partner/spouse (ST)

Internationalization usage for Germanic languages. This component is optional. An example of a <surname prefix> is the "van" in "Ludwig van Beethoven." Since the <surname prefix> doesn't sort completely alphabetically, it is reasonable to specify it as a separate sub-component of the PN and extended PN data types (XPN and XCN).

Note: Subcomponents <own surname prefix>, <own surname>, <surname prefix from partner/spouse> and <surname from partner/spouse> decompose complex Germanic names such as "Irma de Jong-van Beethoven". If these subcomponents are valued, the <surname> subcomponent should still be fully valued for backward compatibility, ie. ...^de Jong-van Beethoven&de&Jong&van&Beethoven^... Also, for clarity, the <last name prefix> has been renamed to <own surname prefix>.

2.9.19.5 Surname from partner/spouse (ST)

The portion of the person's surname (in most Western usage, the last name) that is derived from the surname of the person's partner or spouse, as distinguished from the part derived from the person's own surname. This component is optional.

If no portion of the person's surname is derived from the surname of the person's partner or spouse, this component is not valued. Otherwise, if the surname of the partner or spouse has legally changed to become (or incorporate) the person's surname, this is the surname of the partner or spouse immediately prior to such change.

2.9.20 FT - formatted text data

This data type is derived from the string data type by allowing the addition of embedded formatting instructions. These instructions are limited to those that are intrinsic and independent of the circumstances under which the field is being used. The actual instructions and their representation are described later in this chapter. *The FT field is of arbitrary length (up to 64k)* and may contain formatting commands enclosed in escape characters. Example:

```
| \. sp \ (skip one vertical line) |
```

For additional examples of formatting commands see Section 2.10, "Use of escape sequences in text fields."

Health Level Seven, Version 2.4 © 2000. All rights reserved.

To include alternative character sets, use the appropriate escape sequence. See Section 2.16.9.18, "Character set", and Section 2.16.9.20, "Alternate character set handling."

2.9.21 HD - hierarchic designator

Components: <namespace ID (IS)> ^ <universal ID (ST)> ^ <universal ID type (ID)>

The HD is designed to be more powerful and more general replacement for the application identifier of HL7 versions 2.1 and 2.2. It adds two additional components, the <universal ID> and the <universal ID type> to the former *application ID* (which is renamed more generically to be the *namespace ID*)

The basic definition of the HD is that it identifies an (administrative or system or application or other) entity that has responsibility for managing or assigning a defined set of instance identifiers (such as placer or filler number, patient identifiers, provider identifiers, etc.). This entity could be a particular health care application such as a registration system that assigns patient identifiers, a governmental entity such as a licensing authority that assigns professional identifiers or drivers' license numbers, or a facility where such identifiers are assigned.

In the case where a HD identifies an entity that assigns/creates instance identifiers such as a particular patient registration system, it defines an "assigning authority." In the case where a HD identifies a location where instance identifiers are given out (although they may be created by another entity at another location) such as a particular "department of motor vehicles office location," it defines an "assigning facility." These two different uses of the HD appear in many of the extended data types.

The "assigning authority" defined by the HD is similar in its role to the coding system (and version) part of the coded element data types: both identify a set of more discrete instance identifiers. The difference is that the set of HD-defined discrete instances contain identifiers of "real-world" things such as patient or clinical orders, while the coded element-defined set of discrete instances contains concept identifiers (codes).

The HD is designed to be used either as a local identifier (with only the <namespace ID> valued) or a publicly-assigned identifier, a UID (<universal ID> and <universal ID type> both valued). Syntactically, the HD is a group of two identifiers: a local identifier defined by the first component, and a universal identifier defined by the second and third components. HDs that have defined third components (defined UID types) must have a second component that is unique within the series of IDs defined by that component.

Note: The HD is used in fields that in earlier versions of HL7 used the IS data type. Thus, a single component HD (only the first component valued) will look like a simple IS data type for older systems expecting a single component in the place of the HD data type.

If the first component for the HD data type is present, the second and third components are optional. If the third component is present, then the second must also be present (although in this case the first is optional). The second and third components must either both be valued (both non-null), or both be not valued (both null).

This means that if all three components of the HD are valued, the entity identified by the first component is the same as the entity identified by components two and three taken together. However, implementers may choose, by site agreement, to specify that if all three components of the HD are valued, the first component defines a member in the set defined by the second and third components.

2.9.21.1 Namespace ID (IS)

<u>User-defined Table 0300 - Namespace ID</u> is used as the HL7 identifier for the user-defined table of values for this component.

User-defined Table 0300 – Namespace ID

Value	Description
	No suggested values defined

Note: When the HD is used in a given segment (either as a field or as a component of another data type) this table may be re-defined (given a different user-defined table number and name) by the technical committee responsible for that segment.

2.9.21.2 Universal ID (ST)

The HD's second component, <universal ID> (UID), is a string formatted according to the scheme defined by the third component, <universal ID type> (UID type). The UID is intended to be unique over time within the UID type. It is rigorously defined. Each UID must belong to one of the specifically enumerated schemes for constructing UIDs (defined by the UID type). The UID (second component) must follow the syntactic rules of the particular universal identifier scheme (defined by the third component). Note that these syntactic rules are not defined within HL7 but are defined by the rules of the particular universal identifier scheme (defined by the third component).

2.9.21.3 Universal ID type (ID)

The third component governs the interpretation of the second component of the HD. If the third component is a known UID refer to <u>HL7 Table 0301 - Universal ID type</u> for valid values, then the second component is a universal ID of that type.

Value	Description
DNS	An Internet dotted name. Either in ASCII or as integers
GUID	Same as UUID.
HCD	The CEN Healthcare Coding Scheme Designator. (Identifiers used in DICOM follow this assignment scheme.)
HL7	Reserved for future HL7 registration schemes
ISO	An International Standards Organization Object Identifier
L,M,N	These are reserved for locally defined coding schemes.
Random	Usually a base64 encoded string of random bits.
	The uniqueness depends on the length of the bits. Mail systems often generate ASCII string "unique names," from a combination of random bits and system names. Obviously, such identifiers will not be constrained to the base64 character set.
UUID	The DCE Universal Unique Identifier
x400	An X.400 MHS format identifier
x500	An X.500 directory name

HL7 Table 0301 - Universal ID type

Note: X400, X500, and DNS are not technically universally valid for all time. Names can be de-registered from an existing user and registered to a new user.

Examples:

Universal ID examples with only the 2nd and 3rd components valued:

^1. 2. 344. 24. 1. 1. 3^ISO

A HD consisting only of an ISO UID.

^1. 2. 34. 4. 1. 5. 1. 5. 1, 1. 13143143. 131. 3131. 1^ISO

The syntax of the second component is defined by the ISO standard for object identifiers, not by HL7 (for which the second component is of the ST data type). Thus the periods (".") and comma (",") in the second component are part of the ISO syntax, but are legal by the definition of the HL7 ST data type.

^14344. 14144321. 4122344. 14434. 654^GUID

^fal con. i upui . edu^DNS

An internet example

^40C983F09183B0295822009258A3290582^RANDOM

An example of a RANDOM UID

Local examples:

LAB1

Local use only: a HD that looks like an IS data type

PathLab^PL. UCF. UC^L

The 'PathLab' application is identified by the namespace component but it is also identified by the 2^{nd} and 3^{rd} components, (i.e., by the locally-defined UID system "L"). The two identifiers are equivalent. This is a more complex HD in which the middle component, which is locally defined, is itself structured. As with the ISO example above, the middle component's structure is not defined by HL7 but by the site according to its own needs: the only requirement is that the middle component's structure is allowed by the HL7 string (ST) data type.

RX. PIMS. SystemB. KP. CA. SCA

Local use only: a HD that looks like an IS data type. Again, note that the syntax of the first component is not defined by HL7 but by the site according to its own needs: the only requirement is that the first component's structure is allowed by the HL7 string (ST) data type, which is used for values by the IS data type.

^RX. PIMS. SystemB. CA. SCA^M

An alternate way to encode the previous example, illustrating the use of the third component value of "M" (see above <u>*HL7 Table 0301*</u>) to identify a locally-defined identifier set. The second component has the same value as the previous example but is now defined to be a member of a set of allowable values defined by a site for the identifier set "M".

Examples containing both local and universal ID types:

LAB1^1. 2. 3. 3. 4. 6. 7^ISO

A HD with an ISO "object Identifier" as a UID and a locally defined system name. Both the first component and the second and third (taken together) refer to the same entity. This example shows that the local value and the universal ID value may be transmitted with a single HD field.

2.9.22 ID - coded value for HL7 defined tables

The value of such a field follows the formatting rules for an ST field except that it is drawn from a table of legal values. There shall be an HL7 table number associated with ID data types. An examples of an ID field is *OBR-25-result status*. This data type should be used only for HL7 tables (see Section 2.7.6, "Table"). The reverse is not true, since in some circumstances it is more appropriate to use the CE data type for HL7 tables.

2.9.23 IS - coded value for user-defined tables

The value of such a field follows the formatting rules for a ST field except that it is drawn from a sitedefined (or user-defined) table of legal values. There shall be an HL7 table number associated with IS data types. An example of an IS field is the *Event reason code* defined in Section 3.3.1.4, "Event reason code."

Page 2-48

This data type should be used only for user-defined tables (see Section 2.7.6, "Table"). The reverse is not true, since in some circumstances, it is more appropriate to use the CE data type for user-defined tables.

2.9.24 JCC - job code/class

Components: <job code (IS)> ^ <job class (IS)>

2.9.24.1 Job code (IS)

This component contains the person's job code. <u>User-defined Table 0327 - Job code</u> is used as the HL7 identifier for the user-defined table of values for this component.

User-defined Table 0327 – Job code

Value	Description
	No suggested values defined

2.9.24.2 Job class (IS)

This component contains the person's employee classification. <u>User-defined Table 0328 - Employee classification</u> is used as the HL7 identifier for the user-defined table of values for this component.

Value	Description
	No suggested values defined

2.9.25 MA - multiplexed array

```
Components: <sample 1 from channel 1 (NM)> ^ <sample 1 from channel 2 (NM)> ^ <sample 1 from
channel 3 (NM)> ...~<sample 2 from channel 1 (NM)> ^ <sample 2 from channel 2 (NM)> ^
<sample 2 from channel 3 (NM)> ...~
```

This data type is used to represent channel-multiplexed waveform data, (e.g., the digitized values from an analog-to-digital converter or other digital data source). Refer to Chapter 7, Section 7.14.1.2, "MA - multiplexed array," for a complete description of this data type.

2.9.26 MO - money

Components: <quantity (NM)> ^ <denomination (ID)>

Note: Intent is that it appear only as a component of data type CP. Used independently in chapter 8, section 8.10.3.

2.9.26.1 Quantity (NM)

The first component is a quantity.

2.9.26.2 Denomination (ID)

The second component is the denomination in which the quantity is expressed. The values for the denomination component are those specified in ISO-4217. If the denomination is not specified, *MSH-17-country code* is used to determine the default. Example:

|99. 50^USD|

where USD is the ISO 4217 code for the U.S. American dollar.

2.9.27 NA - numeric array

This data type is used to represent a series (array) of numeric values, each one having a data type of NM. Refer to Chapter 7, Section 7.14.1.1, "NA - numeric array," for a complete description of this data type.

2.9.28 NM - numeric

A number represented as a series of ASCII numeric characters consisting of an optional leading sign (+ or -), the digits and an optional decimal point. In the absence of a sign, the number is assumed to be positive. If there is no decimal point the number is assumed to be an integer. Examples:

999

|-123.792|

Leading zeros, or trailing zeros after a decimal point, are not significant. For example, the following two values with different representations, "01.20" and "1.2", are identical. Except for the optional leading sign (+ or -) and the optional decimal point (.), no non-numeric ASCII characters are allowed. Thus, the value <12 should be encoded as a structured numeric (SN) (preferred) or as a string (ST) (allowed, but not preferred) data type.

2.9.29 PL - person location

```
Components: <point of care (IS)> ^ <room (IS)> ^ <bed (IS)> ^ <facility (HD)> ^ < location status (IS )> ^ <person location type (IS)> ^ <building (IS )> ^ <floor (IS)> ^ <lo-cation description (ST)>
```

Note: This data type contains several location identifiers that should be thought of in the following order from the most general to the most specific: facility, building, floor, point of care, room, bed. Additional data about any location defined by these components can be added in the following components: person location type, location description and location status.

This data type is used to specify a patient location within a healthcare institution. Which components are valued depends on the needs of the site. For example for a patient treated at home, only the person location type is valued. It is most commonly used for specifying patient locations, but may refer to other types of persons within a healthcare setting.

Example: Nursing Unit

A nursing unit at Community Hospital: 4 East, room 136, bed B

4E^136^B^Communi tyHospi tal ^^N^^^

Example: Clinic

A clinic at University Hospitals: Internal Medicine Clinic located in the Briones building, 3rd floor.

Internal Medicine^^^UniversityHospitals^^C^Briones^3^

Example: Home

The patient was treated at his home.

~~~~**H**~~~

## 2.9.29.1 Point of care (IS)

Conditional on person location type (e.g., nursing unit or department or clinic). After floor, most general patient location designation. <u>User-defined Table 0302 - Point of care</u> is used as the HL7 identifier for the user-defined table of values for this component.

| Value | Description                 |
|-------|-----------------------------|
|       | No suggested values defined |

## 2.9.29.2 Room (IS)

Patient room. After point of care, most general person location designation. <u>User-defined Table 0303 -</u> <u>Room</u> is used as the HL7 identifier for the user-defined table of values for this component.

| Value | Description                 |
|-------|-----------------------------|
|       | No suggested values defined |

2.9.29.3 Bed (IS)

Patient bed. After room, most general person location designation. <u>User-defined Table 0304 - Bed</u> is used as the HL7 identifier for the user-defined table of values for this component.

| Value | Description                 |
|-------|-----------------------------|
|       | No suggested values defined |

## 2.9.29.4 Facility (HD)

Subject to site interpretation but generally describes the highest level physical designation of an institution, medical center or enterprise. Most general person location designation.

(See Section 2.9.21, "HD - hierarchic designator") for discussion of data type.

**Note:** When the HD data type is used in a given segment as a component of a field of another data type, <u>User-defined</u> <u>Table 0300 - Namespace ID</u> (referenced by the first sub-component of the HD component) may be redefined (given a different user-defined table number and name) by the technical committee responsible for that segment.

## 2.9.29.5 Location status (IS)

Location (e.g., Bed) status. <u>User-defined Table 0306 - Location status</u> is used as the HL7 identifier for the user-defined table of values for this component.

| Value | Description                 |
|-------|-----------------------------|
|       | No suggested values defined |

#### 2.9.29.6 Person location type (IS)

Person location type is the categorization of the person's location defined by facility, building, floor, point of care, room or bed. Although not a required field, when used, it may be the only populated field. Usually

includes values such as nursing unit, department, clinic, SNF, physician's office. <u>User-defined Table 0305 -</u> <u>Person location type</u> is used as the HL7 identifier for the user-defined table of values for this component.

| Value | Description       |
|-------|-------------------|
| С     | Clinic            |
| D     | Department        |
| Н     | Home              |
| N     | Nursing Unit      |
| 0     | Provider's Office |
| Р     | Phone             |
| S     | SNF               |

## 2.9.29.7 Building (IS)

After facility, most general person location designation. <u>User-defined Table 0307 - Building</u> is used as the HL7 identifier for the user-defined table of values for this component.

User-defined Table 0307 - Building

| Value | Description                 |
|-------|-----------------------------|
|       | No suggested values defined |

## 2.9.29.8 Floor (IS)

After building, most general person location designation. <u>User-defined Table 0308 - Floor</u> is used as the HL7 identifier for the user-defined table of values for this component.

| User-defined | Table | 0308 - | - Floor |
|--------------|-------|--------|---------|
|--------------|-------|--------|---------|

| Value | Description                  |
|-------|------------------------------|
|       | No suggested values defined. |

#### 2.9.29.9 Location description (ST)

A free text description of the location.

## 2.9.30 PN - person name

```
Components: <family name (FN) > ^ <given name (ST)> ^ < second and further given names or ini-
tials thereof (ST)> ^ <suffix (e.g., JR or III) (ST)> ^ <prefix (e.g., DR) (ST)> ^
<degree (e.g., MD) (IS)>
Subcomponents of family name: <surname (ST)> &<own surname prefix (ST)> &<own surname (ST)>
&<surname prefix from partner/spouse (ST)> &<surname from partner/spouse (ST)>
```

#### Note: Replaced by XPN data type as of v 2.3

Length: 48

This data type includes multiple free text components. The sending system may send upper- and lowercase or all uppercase. The receiving system may convert to all uppercase if required. Example:

| SMI TH^JOHN^J^I I I ^DR^PHD |

#### 2.9.30.1 Family name (FN)

This component allows full specification of the surname of a person. Where appropriate, it differentiates the person's own surname from that of the person's partner or spouse, in cases where the person's name may contain elements from either name. It also permits messages to distinguish the surname prefix (such as "van" or "de") from the surname root. See section 2.9.19

## 2.9.30.2 Given name (ST)

First name.

2.9.30.3 Second and further given names or initials thereof (ST)

Multiple middle names may be included by separating them with spaces.

## 2.9.30.4 Suffix (ST)

Used to specify a name suffix (e.g., Jr. or III).

2.9.30.5 Prefix (ST)

Used to specify a name prefix (e.g., Dr.).

2.9.30.6 Degree (IS)

Used to specify an educational degree (e.g., MD). Refer to <u>User-defined Table 0360 – Degree</u> for suggested values.

## 2.9.30.6.1 Internationalization note

In countries using ideographic or syllabic (phonetic) character sets, it is sometimes necessary to send the name in one or both of these formats, as well as an alphabetic format. The switching between the different character sets can be accomplished using a character set such as JIS X 0202 - ISO 2022 which provides an escape sequence for switching among different character sets and among single-byte and multi-byte character representations. When the name field is repeated, the different repetitions of the name may be represented by these different character sets. The details are as follows. (See also Section 2.9.2, "Escape sequences supporting multiple character sets for PN, XPN, XCN, XAD, FT, ST and TX data types.")

HL7 supports the following standards for Japanese characters:

JIS X 0201 for ISO-IR 13 (Japanese Katakana)

JIS X 0201 for ISO-IR 14 (Japanese Romaji)

JIS X 0208 for ISO-IR 87 (Japanese Kanji, Hiragana and Katakana)

JIS X 0212 for ISO-IR 159 (supplementary Japanese Kanji)

HL7 supports the following standards for European characters:

ISO 8859 (1-9) for ISO-IR 100, 101, 109, 110, 144,127, 126, 138 and 148.

Character sets are referenced in HL7 as ASCII, 8859/1,.8859/2, ISO IR14, ISO IR87, and ISO IR159. DICOM uses codes laid out in ISO 2375, of the form 'ISO-IR xxx'. HL7 supports this naming as well, to facilitate interoperability.

HL7 uses the Basic G0 Set of the International Reference Version of ISO 646:1990 (ISO IR-6) as the default character repertoire for character strings. This is a single-byte character set, identical to ASCII.

Each repetition of a PN, XPN, XON, XCN, or XAD field is assumed to begin with the default character set. If another character set is to be used, the HL7 defined escape sequence used to announce that character set must be at the beginning of the repetition, and the HL7 defined escape sequence used to start the default character set must be at the end of the repetition. Note also that several character sets may be intermixed within a single repetition as long as the repetition ends with a return to the default character set.

An application must specify which character sets it supports in the field "MSH-18 Character Sets" and which character set handling scheme it supports in the field *MSH-20-Alternate character set handling scheme*. It is assumed that the sending and receiving applications are aware of how to map character set names (i.e., ISO-IR xxx) to escape sequences.

For example, in many Japanese messages there is a mix of Romaji (i.e., Roman characters), Katakana (phonetic representation of foreign words), Hiragana (phonetic representation of Japanese words) and Kanji (pictographs). Such a message would require 4 character sets be specified in the MSH.

14. RFC 1468 Japanese Character Encoding for Internet Messages

This approach is in harmony with DICOM.

Character Repertoires supported by DICOM are defined in Part 5, section 62E1, of Supplement 9. It says, "Values that are text or character strings can be composed of Graphic and Control Characters. The Graphic Character set, independent of its encoding, is referred to as a Character Repertoire. Depending on the native context in which Application Entities wish to exchange data using the DICOM standard, different character repertoires will be used. The Character Repertoires supported by DICOM are defined in ISO 8859."

In addition, DICOM supports the following Character Repertoires for the Japanese Language:

JIS X 0201-1976 - Code for Information Exchange

JIS X 0208-1990 - Code for the Japanese Graphic Character set for information interchange

JIS X 0212-1990 - Code of the supplementary Japanese Graphic Character set for information interchange

## 2.9.31 PPN - performing person time stamp

Components: <ID number (ST)> ^ <family name (FN)> ^ <given name (ST) ^ <second and further given names or initials thereof (ST)> ^ <suffix (e.g., JR or III) (ST)> ^ <prefix (e.g., DR) (ST)> ^ <degree (e.g., MD) (IS)> ^ <source table (IS)> ^ <assigning authority (HD)> ^ <name type code(ID)> ^ <identifier check digit (ST)> ^ <code identifying the check digit scheme employed (ID )> ^ <identifier type code (IS)> ^ <assigning facility (HD)> ^ < date/time action performed (TS)> ^ <name representation code (ID)> ^ <name context (CE)> ^ <name validity range (DR)> ^ <name assembly order (ID)> Subcomponents of family name: <surname (ST)> &<own surname prefix (ST)> &<own surname (ST)>

&<surname prefix from partner/spouse (ST)> &<surname from partner/spouse (ST)>

Subcomponents of name validity range: <date range start date/time (TS)> & <date range end date/time (TS)>

#### Length: 250

This data type is the equivalent of an XCN data type joined with a TS data type. However, since HL7 does not support subcomponents in Version 2.3, the XCN data type has been flattened.

#### 2.9.31.1 ID number (ST)

Coded ID according to a user-defined table, defined by the 8<sup>th</sup> component. If the first component is present, either the source table or the assigning authority must be valued.

#### 2.9.31.2 Family name (FN)

This component allows full specification of the surname of a person. Where appropriate, it differentiates the person's own surname from that of the person's partner or spouse, in cases where the person's name may contain elements from either name. It also permits messages to distinguish the surname prefix (such as "van" or "de") from the surname root. See section 2.9.19.

## 2.9.31.3 Given name (ST)

First name.

## 2.9.31.4 Second and further given names or initials thereof (ST)

Multiple middle names may be included by separating them with spaces.

## 2.9.31.5 Suffix (ST)

Used to specify a name suffix (e.g., Jr. or III).

## 2.9.31.6 Prefix (ST)

Used to specify a name prefix (e.g., Dr.).

## 2.9.31.7 Degree (IS)

Used to specify an educational degree (e.g., MD). Refer to <u>User-defined Table 0360 – Degree</u> for suggested values.

## 2.9.31.8 Source table (IS)

<u>User-defined Table 0297 - CN ID</u> source is used as the HL7 identifier for the user-defined table of values for this component. Used to delineate the first component.

## 2.9.31.9 Assigning authority (HD)

The assigning authority is a unique identifier of the system (or organization or agency of department) that creates the data. It is a HD data type. <u>User-defined Table 0363 – Assigning authority</u> is used as the HL7 identifier for the user-defined table of values for the first sub-component of the HD component, <name-space ID>.

**Note:** When the HD data type is used in a given segment as a component of a field of another data type, <u>User-defined</u> <u>Table 0300 - Namespace ID</u> (referenced by the first sub-component of the HD component) may be re-defined (given a different user-defined table number and name) by the technical committee responsible for that segment.

By site agreement, implementers may continue to use <u>User-defined Table 0300 – Namespace ID</u> for the first sub-component.

## 2.9.31.10 Name type code (ID)

A code that represents the type of name. Refer to <u>*HL7 Table 0200 - Name type*</u> for valid values (see Section 2.9.55, "XPN - extended person name").

## 2.9.31.11 Identifier check digit (ST)

The check digit in this data type is not an add-on produced by the message processor. It is the check digit that is part of the identifying number used in the sending application. If the sending application does not include a self-generated check digit in the identifying number, this component should be valued null.

## 2.9.31.12 Code identifying the check digit scheme employed (ID)

Refer to <u>HL7 Table 0061 - Check digit scheme</u> for valid values.

Page 2-56

## 2.9.31.13 Identifier type code (IS)

A code corresponding to the type of identifier. In some cases, this code may be used as a qualifier to the "Assigning authority" component. Refer to <u>HL7 Table 0203 - Identifier type</u> for suggested values.

## 2.9.31.14 Assigning facility (HD)

The place or location identifier where the identifier was first assigned to the patient. This component is not an inherent part of the identifier but rather part of the history of the identifier: as part of this data type, its existence is a convenience for certain intercommunicating systems.

**Note:** When the HD data type is used in a given segment as a component of a field of another data type, <u>User-defined</u> <u>Table 0300 - Namespace ID</u> (referenced by the first sub-component of the HD component) may be re-defined (given a different user-defined table number and name) by the technical committee responsible for that segment.

## 2.9.31.15 Date/time action performed (TS)

This component describes when the activity was performed.

**Note:** If this field is not null, both the performing person and the time stamp must be valued.

### 2.9.31.16 Name representation code (ID)

Different name/address types and representations of the same name/address should be described by repeating of this field, with different values of the Name/Address Type and/or Name/Address Representation component.

**Note:** This new component remains in "alphabetic" representation with each repetition of the field using these data types. I.e. even though the name may be represented in an ideographic character set, this component will remain represented in an alphabetic character set.

| HL7 Table 0465 - Name/address representation | HL7 Table 04 | 465 - Name/addre | ss representation |
|----------------------------------------------|--------------|------------------|-------------------|
|----------------------------------------------|--------------|------------------|-------------------|

| Value | Description                                      |
|-------|--------------------------------------------------|
| I     | Ideographic (i.e., Kanji)                        |
| А     | Alphabetic (i.e., Default or some single-byte)   |
| Р     | Phonetic (i.e., ASCII, Katakana, Hiragana, etc.) |

In general this component provides an indication of the representation provided by the data item. It does not necessarily specify the character sets used. Thus, even though the representation might provide an indication of what to expect, the sender is still free to encode the contents using whatever character set is desired. This component provides only hints for the receiver, so it can make choices regarding what it has been sent and what it is capable of displaying.

## 2.9.31.17 Name context (CE)

This component is used to designate the context in which a name is used. The main use case is in Australian healthcare: indigenous patients who prefer to use different names when attending different healthcare institutions. Another use case occurs in the US where health practitioners can be licensed under slightly different names and the reporting of the correct name is vital for administrative purposes. Refer to chapter 3, section 3.4.2.6 for more detailed information on how to use this table. Refer to *User-defined table 0448* – *Name context* for suggested values;

User-defined Table 0448 - Name context

| Value | Description                 |
|-------|-----------------------------|
|       | No suggested values defined |

#### 2.9.31.18 Name validity range (DR)

This component contains the start and end date/times which define the period during which this name was valid. See section 2.9.14, "DR - date/time range" for description of subcomponents.

#### 2.9.31.19 Name assembly order (ID)

A code that represents the preferred display order of the components of this person name. Refer to <u>*HL7*</u> <u>*Table 0444 – Name assembly order*</u> for valid values.

| Value | Description                       |
|-------|-----------------------------------|
| G     | Prefix Given Middle Family Suffix |
| F     | Prefix Family Middle Given Suffix |

HL7 Table 0444 – Name assembly order

# 2.9.32 PT - processing type

Components: <processing ID (ID)> ^ <processing mode (ID)>

This data type indicates whether to process a message as defined in HL7 Application (level 7) Processing rules.

## 2.9.32.1 Processing ID (ID)

A value that defines whether the message is part of a production, training, or debugging system. Refer to <u>*HL7 Table 0103 - Processing ID*</u> for valid values.

## 2.9.32.2 Processing mode (ID)

A value that defines whether the message is part of an archival process or an initial load. Refer to <u>*HL7 Ta-ble 0207 - Processing mode*</u> for valid values.

# 2.9.33 QIP - query input parameter list

Components: <segment field name (ST) > ^ <value1 (ST) & value2 (ST) & value3 (ST) ...>

Example:

@PID. 5. 1^EVANS

Definition: This field contains the list of parameter names and values to be passed to the stored procedure.

## 2.9.33.1 Segment field name (ST)

This component contains the segment field name.

Naming conventions:

Segment field names are designated by the "@" symbol concatenated with the HL7 segment ID followed by the sequence number for the field separated by a period (see sections 2.6, "SEGMENTS" and 2.7.1,

"Position (sequence within the segment)" for a definition of segment ID and sequence number). If the field is divided into components, the designation may be suffixed with ".nn," to identify a particular component (a suffix of ".3" indicates the third component of the field); otherwise, the whole field is assumed. If the field is further divided into subcomponents, the designation is suffixed with ".nn.mm," which identifies the component and subcomponent requested by relative position.

Site-specific segment field names may be used. In this case, the site-specific segment ID (if the field is not being added to an existing HL7 segment) and the sequence number must be defined so that they do not conflict with existing HL7 segment IDs and field sequence numbers.

Values for this field are defined in the function-specific chapters of this specification.

**Note:** If the "@" is being used as one of the delimiter characters defined in MSH-2-encoding characters, it must be "escaped." (See Section 2.10.1, "Formatting codes".)

2.9.33.2 Value1 & value2 & value3 (ST)

This component contains the field value or values in the form "value1& value2 & value3..."

A single valued parameter contains only a single subcomponent in the second component: thus no subcomponent delimiters are needed (e.g., <segment field name> ^ <value>). A simple list of values (i.e., a one-dimensional array) may be passed instead of a single value by separating each value with the subcomponent delimiter: ,"<segment field name> ^ <value1 & value2 &...>"

# 2.9.34 QSC - query selection criteria

Components: <segment field name(ST)> ^ <relational operator (ID)> ^ <value (ST)> ^ <relational conjunction (ID)>

Example:

@PID. 5. 1^EQ^EVANS|

Definition: This field indicates the conditions that qualify the rows to be returned in the query response. (This field conveys the same information as the "WHERE" clause in the corresponding SQL expression of the query, but is formatted differently.)

## 2.9.34.1 Segment field name (ST)

The name of the field that is participating as a qualifier (usually the "key"). Refer to Section 2.9.33.1, "Segment field name (ST)," for segment field name conventions.

## 2.9.34.2 Relational operator (ID)

Refer to HL7 Table 0209 - Relational operator for valid values.

| Relational operator | Value                 |
|---------------------|-----------------------|
| EQ                  | Equal                 |
| NE                  | Not Equal             |
| LT                  | Less than             |
| GT                  | Greater than          |
| LE                  | Less than or equal    |
| GE                  | Greater than or equal |

| Relational operator | Value    |
|---------------------|----------|
| СТ                  | Contains |
| GN                  | Generic  |

## 2.9.34.3 Value (ST)

The value to which the field will be compared.

#### 2.9.34.4 Relational conjunction (ID)

Refer to <u>*HL7 Table 0210 - Relational conjunction*</u> for valid values. The relational conjunction is defined as follows: If more than one comparison is to be made to select qualifying rows, a conjunction relates this repetition of the field to the next.

| Relational conjunction | Note    |
|------------------------|---------|
| AND                    | Default |
| OR                     |         |

HL7 Table 0210 - Relational conjunction

- When applied to strings, the relational operators LT, GT, LE, and GE imply an alphabetic comparison.
- A "generic" comparison selects a record for inclusion in the response when the beginning of the designated field matches the select string.
- Where a repeating field is specified as an operand, a match on any instance of that field qualifies the row for inclusion in the response message.
- AND takes precedence over OR. More sophisticated precedence rules require that the query be expressed as an embedded query language message or a stored procedure query message (see chapter 5)

# 2.9.35 RCD - row column definition

Components: <segment field name (ST)> ^ <HL7 data type (ID)> ^ <maximum column width (NM)>

Example: This defines a column containing the value of the "last name" component of PID-5, expressed as a ST data type with a maximum width of 20.

@PID. 5. 1^ST^20

Definition: This specifies the format of a column in terms of a segment field name, a data type, and a maximum length. It consists of three components:

## 2.9.35.1 Segment field name (ST)

The HL7 segment field name, which identifies the field occupying the column. (Refer to Section 2.9.33.1, "Segment field name (ST)," for segment field name definition conventions.)

## 2.9.35.2 HL7 data type (ID)

The two or three character HL7 data type. Refer to HL7 Table 0440 - Data Types for valid values.

## 2.9.35.3 Maximum column width (NM)

The maximum width of the column, as dictated by the responding system. (This may vary from the HL7-defined maximum field length.)

# 2.9.36 RI - repeat interval

Components: <repeat pattern (IS)> ^ <explicit time interval (ST)>

Definition: This field contains the interval between repeating appointments. The default setting indicates that the appointment should occur once, when the component is not valued. The definition of this field is equivalent to the definition of the Interval component of the Quantity/Timing field given in Chapter 4, Section 4.4.2 "Interval component (CM)."

#### 2.9.36.1 Repeat pattern (IS)

The first component is defined by *User-defined Table 0335 - Repeat pattern*. See Section 4.3.2.1 "Repeat pattern," for further details.

#### 2.9.36.2 Explicit time interval (ST)

The second component explicitly lists the actual times referenced by the code in the first subcomponent, in the following format: HHMM,HHMM,HHMM,.... This second subcomponent will be used to clarify the first subcomponent in cases where the actual administration times vary within an institution. See Section 4.4.2.2, "Explicit time interval," for further details.

# 2.9.37 RP - reference pointer

 $\label{eq:components: components: <pointer (ST) > ^ < application ID (HD) > ^ <type of data (ID) > ^ <subtype (ID) >$ 

This data type transmits information about data stored on another system. It contains a reference pointer that uniquely identifies the data on the other system, the identity of the other system, and the type of data.

## 2.9.37.1 Pointer (ST)

A unique key assigned by the system that stores the data. The key, which is a ST data type, is used to identify and access the data.

## 2.9.37.2 Application ID (HD)

Subcomponents: <namespace ID (IS)> & < universal ID (ST)> & <universal ID type (ID)>

A unique designator of the system that stores the data. It is a HD data type (See Section 2.9.21, "HD - hierarchic designator"). Application ID's must be unique across a given HL7 implementation.

#### 2.9.37.3 Type of data (ID)

An ID data type that declares the general type of data. Refer to <u>*HL7 Table 0191- Type of referenced data*</u> for valid values.

| Value | Description                                                                      |
|-------|----------------------------------------------------------------------------------|
| AP    | Other application data, typically uninterpreted binary data (HL7 V2.3 and later) |
| AU    | Audio data (HL7 V2.3 and later)                                                  |

HL7 Table 0191 - Type of referenced data

| Value     | Description                                           |
|-----------|-------------------------------------------------------|
| FT        | Formatted text (HL7 V2.2 only)                        |
| IM        | Image data (HL7 V2.3 and later)                       |
| multipart | MIME multipart package                                |
| NS        | Non-scanned image (HL7 V2.2 only)                     |
| SD        | Scanned document (HL7 V2.2 only)                      |
| SI        | Scanned image (HL7 V2.2 only)                         |
| TEXT      | Machine readable text document (HL7 V2.3.1 and later) |
| ТХ        | Machine readable text document (HL7 V2.2 only)        |

## 2.9.37.4 Subtype (ID)

An ID data type declaring the format for the data of subcomponent <main type>. Refer to <u>*HL7 Table 0291</u>* - <u>*Subtype of referenced data*</u> for valid values.</u>

| Value                   | Description                                                 |
|-------------------------|-------------------------------------------------------------|
| BASIC                   | ISDN PCM audio data                                         |
| DICOM                   | Digital Imaging and Communications in Medicine              |
| FAX                     | Facsimile data                                              |
| GIF                     | Graphics Interchange Format                                 |
| HTML                    | Hypertext Markup Language                                   |
| JOT                     | Electronic ink data (Jot 1.0 standard)                      |
| JPEG                    | Joint Photographic Experts Group                            |
| Octet-stream            | Uninterpreted binary data                                   |
| PICT                    | PICT format image data                                      |
| PostScript              | PostScript program                                          |
| RTF                     | Rich Text Format                                            |
| SGML                    | Standard Generalized Markup Language (HL7 V2.3.1 and later) |
| TIFF                    | TIFF image data                                             |
| x-hl7-cda-<br>level-one | HL7 Clinical Document Architecture Level One document       |
| XML                     | Extensible Markup Language (HL7 V2.3.1 and later)           |

HL7 Table 0291 - Subtype of referenced data

## 2.9.37.5 Type-subtype combinations

Possible subtypes are specific to main types (though in principle the same subtype could be used for more than one main type), and so are defined under their main types.

Additional subtypes may be added to this Standard. In addition, private, non-standard subtypes may be defined by agreement between cooperating parties. All private, non-standard subtypes should begin with the letter  $\mathbf{Z}$  to distinguish them from the standard subtypes.

2.9.37.5.1 Image subtypes

TIFF = TIFF image data

TIFF (Tagged Image File Format) is one of the common formats for scanned images. Its first version was developed in 1986 by Aldus Corporation as a standard for encoding scanned images. The official version of the TIFF standard is now maintained by Adobe Corporation. TIFF format is specified in the document "TIFF, Revision 6.0." Adobe Systems Incorporated, 1585 Charleston Road, P.O. Box 7900, Mountain View, CA 94039-7900. (415) 961-4400

The subtype "TIFF" implies recognition of that trademark and all the rights it entails.

PICT = PICT format image data

PICT is one of the common formats for scanned images. PICT is a graphics format developed by Apple Computer, Inc., Cupertino, California. PICT format is officially defined in the book set "Inside Macintosh," published by Addison-Wesley Publishing Company, Reading, Massachusetts.

 ${\tt DICOM}$  = the Digital Imaging and Communications in Medicine (DICOM) standard

DICOM is the format developed jointly by the American College of Radiology (ACR) and the National Electrical Manufacturers Association (NEMA) as the standard for interchange of radiological images and ancillary data. It is standardized as NEMA PS3, and is available from: NEMA, 2101 L Street NW, Washington, DC 20037

DICOM specifies a complete communications standard, including a generic messaging service for two-way exchange of imaging-related information between applications, as well as transfer of the actual images. In HL7, the use of DICOM data is limited to images only.

Images in this subtype shall be encoded according to the Generic DICOM File Format defined in DICOM Part 10, Media Storage and File Format (NEMA PS3.10). This shall be in accordance with the Image Information Object Definitions of DICOM Part 3 (NEMA PS3.3), Data Structure and Semantics of DICOM Part 5 (NEMA PS3.5), and the Data Dictionary of DICOM Part 6 (NEMA PS3.6).

The Generic DICOM File Format consists of two parts: a DICOM File Meta Information Header, immediately followed by a DICOM Data Set. The DICOM Data Set contains the image or images specified according to DICOM Part 10. The DICOM File Meta Information Header contains, among other information, a Transfer Syntax UID (Unique Identifier) which completely specifies the encoding of the Data Set according to DICOM Part 5. This encoding defines big endian vs. little endian byte ordering, as well as image compression via the JPEG (Joint Photographics Experts Group) standard (ISO/IS 10918-1 and 10918-2). The transfer syntax of the File Meta Information Header itself is little endian byte ordered, as required by DICOM Part 10.

FAX = facsimile data

Facsimile data as specified by CCITT standards F1.60, F1.80, F1.82, and F1.84.

Jot = electronic ink data, as specified by the Jot 1.0 standard

The JOT standard, proposed jointly by Slate Corporation, Microsoft, Apple, Lotus, GO, and General Magic, allows handwritten notes, sketches, signatures and other free-form written data to be transmitted. It is the standard by which portable pen computers or workstations equipped with stylus-input tablets can represent and exchange information.

It represents electronic ink as a series of stylus strokes, and therefore contains necessary information for potential automatic handwriting recognition, which would be lost if converted to other image representa-

Health Level Seven, Version 2.4 © 2000. All rights reserved.

tions. It may, however, be readily converted to another image representation for purposes of printing or display.

The JOT 1.0 standard is available from: Software Publishers Association, 1730 M Street Northwest, Suite 700

Washington, DC 20036-4510, (202) 452-1600

#### 2.9.37.5.2 Audio subtypes

basic = ISDN PCM audio data

Telephone quality audio data, encoded as 8-bit ISDN mu-law Pulse Code Modulation sampled at 8 kHz, according to CCITT Fascicle III.4, Recommendation G.711. This subtype may be used for voice mail messages as well as voice dictation.

#### 2.9.37.5.3 Application subtypes

octet-stream = uninterpreted binary data

This subtype is for binary data which has none of the other standard formats as given by Section 2.9.37.3, "Type of data (ID)." Its interpretation by the system utilizing the data must be mutually agreed upon by sending and receiving parties.

PostScript = PostScript program

A PostScript language program typically representing a formatted document for printing on a PostScript printer, or for display on a computer screen via a PostScript interpreter.

PostScript consists of the original specification, PostScript level 1, described in "PostScript Language Reference Manual," Addison-Wesley, 1985, and a more advanced variant, PostScript level 2, described in "PostScript Language Reference Manual," Addison-Wesley, Second Edition, 1990. PostScript is a registered trademark of Adobe Systems, Inc. Use of the subtype "PostScript" implies recognition of that trademark and all the rights it entails.

Other types may be added as needed.

Example:

|1234A321634BC^EFC^SD|

## 2.9.38 SAD – street address

Components: <street or mailing address (ST)> ^ <street name (ST)> ^ <dwelling number (ST)>

**Note:** Appears ONLY in the XAD data type

## 2.9.38.1 Street or mailing address (ST)

The street or mailing address of a person or institution. When referencing an institution, this first component is used to specify the institution name. When used in connection with a person, this component specifies the first line of the address. 2.9.38.2 Street name (ST)

2.9.38.3 Dwelling number (ST)

# 2.9.39 SCV - scheduling class value pair

Components: class (IS)> ^ <pre

For use only with the scheduling chapter.

Definition: This data type is used to communicate parameters and preferences to the filler application regarding the selection of an appropriate *time slot, resource, location, or filler override criterion* for an appointment.

## 2.9.39.1 Parameter class (IS)

The first component of this field is a code identifying the parameter or preference being passed to the filler application. Refer to <u>User-defined table 0294</u> Time selection criteria parameter class codes for suggested values.

| Parameter Class | Description: Valid Values                                                                                                                                         |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Prefstart       | The preferred start time for the appointment request, service or resource. Any legal time specification in the format HHMM, using 24-hour clock notation          |
| Prefend         | The preferred end time for the appointment request, service or resource. Any legal time specification in the format HHMM, using 24-hour clock notation            |
| Mon             | An indicator that Monday is or is not preferred for the day on which the appointment will occur.<br>OK = Preferred appointment day<br>NO = Day is not preferred   |
| Tue             | An indicator that Tuesday is or is not preferred for the day on which the appointment will occur.<br>OK = Preferred appointment day<br>NO = Day is not preferred  |
| Wed             | An indicator that Wednesday is or is not preferred for the day on which the appointment will occur. OK = Preferred appointment day NO = Day is not preferred      |
| Thu             | An indicator that Thursday is or is not preferred for the day on which the appointment will occur.<br>OK = Preferred appointment day<br>NO = Day is not preferred |
| Fri             | An indicator that Friday is or is not preferred for the day on which the appointment will occur.<br>OK = Preferred appointment day<br>NO = Day is not preferred   |
| Sat             | An indicator that Saturday is or is not preferred for the day on which the appointment will occur.<br>OK = Preferred appointment day<br>NO = Day is not preferred |
| Sun             | An indicator that Sunday is or is not preferred for the day on which the appointment will occur.<br>OK = Preferred appointment day<br>NO = Day is not preferred   |

User-defined Table 0294 - Time selection criteria parameter class codes

## 2.9.39.2 Parameter value (ST)

The second component is the actual data value for that parameter.

For example, if a filler application allows preference parameters to be passed to specify a preferred start time, a preferred end time, and preferred days of the week for the appointment, it may define the following parameter class codes and valid data sets.

## 2.9.40 SI - sequence ID

A non-negative integer in the form of a NM field. The uses of this data type are defined in the chapters defining the segments and messages in which it appears.

# 2.9.41 SN - structured numeric

Components: <comparator (ST)> ^ <numl (NM)> ^ <separator/suffix (ST)> ^ <num2 (NM)>

The structured numeric data type is used to unambiguously express numeric clinical results along with qualifications. This enables receiving systems to store the components separately, and facilitates the use of numeric database queries. The corresponding sets of values indicated with the <comparator> and <separator/suffix> components are intended to be the authoritative and complete set of values. If additional values are needed for the <comparator> and <separator/suffix> components, they should be submitted to HL7 for inclusion in the Standard.

If <num1> and <num2> are both non-null, then the separator/suffix must be non-null. If the separator is "-", the data range is inclusive; e.g., <num1> - <num2> defines a range of numbers *x*, such that: <num1> <=x<= <num2>.

## 2.9.41.1 Comparator (ST)

Defined as greater than, less than, greater than or equal, less than or equal, equal, and not equal, respectively (= ">" or "<" or ">=" or "<" or "<>"

If this component is not valued, it defaults to equal ("=").

#### 2.9.41.2 Num1 (NM)

A number.

#### 2.9.41.3 Separator/suffix (ST)

"-" or "+" or "/" or "." or ":"

Examples:

| >^100       | (greater than 100)                                                                                                                                           |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ^100^- ^200 | (equal to range of 100 through 200)                                                                                                                          |
| ^1^: ^228   | (ratio of 1 to 128, e.g., the results of a serological test) $% \left( $ |
| ^2^+        | (categorical response, e.g., occult blood positivity)                                                                                                        |

#### 2.9.41.4 Num2 (NM)

A number or null depending on the measurement.

## 2.9.42 SRT – sort order

Components: <sort-by field(ST)> ^ <sequencing (ID)>

Specifies those parameters by which the response will be sorted and by what method.

Example: In a tabular response query, where the return data is known by column name, the SRT might look like

|LastName^A~FirstName^A|Example: In a segment response query, where the return data is known by segment and offset, the SRT field would use segment field name notation,

|PID. 3. 1^A~PID. 3. 2|

### 2.9.42.1 Sort-by field (ST)

Identifies the field by which the response will be sorted. In a tabular response, this will be the column name to sort by. In the Segment Pattern and the Display Response, this will be the segment field name to sort by. (see QIP in Section 2.9.33.1, "Segment field name (ST)" for segment field name definition.)

See Chapter 5, "Query", for a complete discussion of queries and their responses.

#### 2.9.42.2 Sequencing (ID)

Identifies how the field or parameter will be sorted; and, if sorted, whether the sort will be case sensitive (the default) or not. Refer to *HL7 Table 0397 – Sequencing* for valid values

| Value | Description                     |
|-------|---------------------------------|
| A     | Ascending                       |
| AN    | Ascending, case<br>insensitive  |
| D     | Descending                      |
| DN    | Descending, case<br>insensitive |
| N     | None                            |

HL7 Table 0397 – Sequencing

## 2.9.43 ST - string data

String data is left justified with trailing blanks optional. Any displayable (printable) ACSII characters (hexadecimal values between 20 and 7E, inclusive, or ASCII decimal values between 32 and 126), except the defined escape characters and defined delimiter characters. Example:

|almost any data at all|

To include any HL7 delimiter character (except the segment terminator) within a string data field, use the appropriate HL7 escape sequence (see Section 2.10.1, "Formatting codes").

Usage note: The ST data type is intended for short strings (e.g., less than 200 characters). For longer strings the TX or FT data types should be used (see Sections 2.9.48, "TX - text data" or 2.9.20, "FT - formatted text data").

Alternate character set note: ST - string data may also be used to express other character sets. See Section 2.15.9.18, "Character set", and Section 2.15.9.20, "Alternate character set handling" for details.

## 2.9.44 TM - time

Format: HH[MM[SS[.S[S[S]]]]]][+/-ZZZZ]

In prior versions of HL7, this data type was always specified to be in the format HHMM[SS[.SSSS]][+/-ZZZZ] using a 24 hour clock notation. In the current and future versions, the precision of a time may be expressed by limiting the number of digits used with the format specification as shown above. By site-

Health Level Seven, Version 2.4 © 2000. All rights reserved.

specific agreement, HHMM[SS[.SSSS]][+/-ZZZZ] may be used where backward compatibility must be maintained.

Thus, HH is used to specify a precision of "hour," HHMM is used to specify a precision of "minute," HHMMSS is used to specify a precision of seconds, and HHMMSS.SSSS is used to specify a precision of ten-thousandths of a second.

In each of these cases, the time zone is an optional component. The fractional seconds could be sent by a transmitter who requires greater precision than whole seconds. Fractional representations of minutes, hours or other higher-order units of time are not permitted.

Note: The time zone [+/-ZZZZ], when used, is restricted to legally-defined time zones and is represented in HHMM format.

The time zone of the sender may be sent optionally as an offset from the coordinated universal time (previously known as Greenwich Mean Time). Where the time zone is not present in a particular TM field but is included as part of the date/time field in the MSH segment, the MSH value will be used as the default time zone. Otherwise, the time is understood to refer to the local time of the sender. Midnight is represented as 0000. Examples:

| 235959+1100  | 1 second before midnight in a time zone eleven<br>hours ahead of Universal Coordinated Time (i.e.,<br>east of Greenwich). |
|--------------|---------------------------------------------------------------------------------------------------------------------------|
| 0800         | Eight AM, local time of the sender.                                                                                       |
| 093544. 2312 | 44.2312 seconds after Nine thirty-five AM, local time of sender.                                                          |
| 13           | 1pm (with a precision of hours), local time of sender.                                                                    |

## 2.9.45 TN - telephone number

For use in the United States and conforming countries, the telephone number is always in the form:

```
Format: [NN] [(999)]999-99999[X999999][B999999][C any text]
```

Note: Replaced by XTN data type as of v 2.3

The optional first two digits are the country code. The optional **X** portion gives an extension. The optional **B** portion gives a beeper code. The optional **C** portion may be used for comments like, **After 6:00**. While no explicit limit is placed on the text field, receiving systems may be expected to truncate values that are more than 10 characters long. To accommodate the variability of institutional phone systems, the length of the extension and beeper numbers may be extended by local agreement. Examples:

```
| (415) 925- 0121X305 |
| 234- 4532CWEEKENDS |
```

# 2.9.46 TQ - timing quantity

Describes when a service should be performed and how frequently. See Chapter 4 (Section 4.3, "QUANTITY/TIMING (TQ) DEFINITION") for a complete description of this data type.

## 2.9.47 TS - time stamp

Format: YYYY[MM[DD[HHMM[SS[.S[S[S]]]]]]][+/-ZZZZ]^<degree of precision>

Contains the exact time of an event, including the date and time. The date portion of a time stamp follows the rules of a date field and the time portion follows the rules of a time field. The time zone (+/-ZZZZ) is represented as +/-HHMM offset from UTC (formerly Greenwich Mean Time (GMT)), where +0000 or -

0000 both represent UTC (without offset). The specific data representations used in the HL7 encoding rules are compatible with ISO 8824-1987(E).

In prior versions of HL7, an optional second component indicates the degree of precision of the time stamp (Y = year, L = month, D = day, H = hour, M = minute, S = second). This optional second component is retained only for purposes of backward compatibility.

By site-specific agreement, YYYYMMDD[HHMM[SS[.S[S[S]]]]]][+/-ZZZZ]^<degree of precision> may be used where backward compatibility must be maintained.

In the current and future versions of HL7, the precision is indicated by limiting the number of digits used, unless the optional second component is present. Thus, YYYY is used to specify a precision of "year," YYYYMM specifies a precision of "month," YYYYMMDD specifies a precision of "day," YYYYMMDDHH is used to specify a precision of "hour," YYYYMMDDHHMM is used to specify a precision of "minute," YYYYMMDDHHMMSS is used to specify a precision of seconds, and YYYYMMDDHHMMSS.SSSS is used to specify a precision of ten thousandths of a second. In each of these cases, the time zone is an optional component. Note that if the time zone is not included, the time-zone defaults to that of the local time zone of the sender. Also note that a TS valued field with the HHMM part set to "0000" represents midnight of the night extending from the previous day to the day given by the YYYMMDD part (see example below). Maximum length of the time stamp is 26. Examples:

#### |19760704010159-0500|

1:01:59 on July 4, 1976 in the Eastern Standard Time zone (USA).

#### |19760704010159-0400|

1:01:59 on July 4, 1976 in the Eastern Daylight Saving Time zone (USA).

#### |198807050000|

Midnight of the night extending from July 4 to July 5, 1988 in the local time zone of the sender.

#### |19880705|

Same as prior example, but precision extends only to the day. Could be used for a birthdate, if the time of birth is unknown.

#### |19981004010159+0100|

1:01:59 on October 4, 1998 in Amsterdam, NL. (Time zone=+0100).

The HL7 Standard strongly recommends that all systems routinely send the time zone offset but does not require it. All HL7 systems are required to accept the time zone offset, but its implementation is application specific. For many applications the time of interest is the local time of the sender. For example, an application in the Eastern Standard Time zone receiving notification of an admission that takes place at 11:00 PM in San Francisco on December 11 would prefer to treat the admission as having occurred on December 11 rather than advancing the date to December 12.

Note: The time zone [+/-ZZZZ], when used, is restricted to legally-defined time zones and is represented in HHMM format.

One exception to this rule would be a clinical system that processed patient data collected in a clinic and a nearby hospital that happens to be in a different time zone. Such applications may choose to convert the data to a common representation. Similar concerns apply to the transitions to and from daylight saving time. HL7 supports such requirements by requiring that the time zone information be present when the information is sent. It does not, however, specify which of the treatments discussed here will be applied by the receiving system.

# 2.9.48 TX - text data

String data meant for user display (on a terminal or printer). Such data would not necessarily be left justified since leading spaces may contribute greatly to the clarity of the presentation to the user. Because this type of data is intended for display, it may contain certain escape character sequences designed to control the display. Escape sequence formatting is defined later in this chapter in Section 2.10 "Use of escape sequences in text fields." Leading spaces should be included. Trailing spaces should be removed. Example:

| leading spaces are allowed.|

Since TX data is intended for display purposes, the repeat delimiter, when used with a TX data field, implies a series of repeating lines to be displayed on a printer or terminal. Therefore, the repeat delimiters are regarded as paragraph terminators or hard carriage returns (e.g., they would display as though a CR/LF were inserted in the text (DOS type system) or as though a LF were inserted into the text (UNIX style system)).

A receiving system would word-wrap the text between repeat delimiters in order to fit it into an arbitrarily sized display window but start any line beginning with a repeat delimiter on a new line.

#### Length: 65536

To include alternative character sets, use the appropriate escape sequence. See Section 2.16.9.18, "MSH-18 Character set (ID) 00692", and Section 2.16.9.20, "MSH-20 Alternate character set handling scheme (ID) 01317."

## 2.9.49 VH - visiting hours

Components: <start day range (ID)> ^ <end day range (ID)> ^ <start hour range (TM)> ^ <end hour range (TM)>

Definition: This data type contains the hours when a patient location is open for visiting. Refer to <u>*HL7</u></u> <u><i>Table 0267 - Days of the week*</u> for valid values for the first two components.</u>

## 2.9.49.1 Start day range (ID)

Starting day of visiting hours range. See HL7 Table 0267 - Days of the week for valid values.

#### 2.9.49.2 End day range (ID)

Ending day of visiting hours range. Starting day of visiting hours range. See <u>HL7 Table 0267 - Days of the</u> <u>week</u> for valid values

| - <b>-</b> |             |
|------------|-------------|
| Value      | Description |
| SAT        | Saturday    |
| SUN        | Sunday      |
| MON        | Monday      |
| TUE        | Tuesday     |
| WED        | Wednesday   |
| THU        | Thursday    |
| FRI        | Friday      |

HL7 Table 0267 - Days of the week

## 2.9.49.3 Start hour range (TM)

Starting hour on starting day of visiting hours range (see first component, 2.9.49.1, "Start day range (ID)").

### 2.9.49.4 End hour range (TM)

Ending hour on ending day of visiting hours range (see second component, 2.9.49.2, "End day range (ID)").

# 2.9.50 VID - version identifier

Components: <version ID (ID)> ^ <internationalization code (CE)> ^ <international version ID (CE)

#### 2.9.50.1 Version ID (ID)

Used to identify the HL7 version. Refer to HL7 Table 0104 - Version ID for valid values.

#### 2.9.50.2 Internationalization code (CE)

Used to identify the international affiliate country code. The values to be used are those of ISO 3166 - 1:1977. The ISO 3166 table has three separate forms of the country code: HL7 specifies that the 3-character (alphabetic) form be used for the country code.

Refer to <u>HL7 Table 0399 – Country code</u> for the 3-character codes as defined by ISO 3166 table.

#### 2.9.50.3 International version ID (CE)

This field component identifies international affiliate's version; it is especially important when the international affiliate has more than a single local version associated with a single US version.

## 2.9.51 XAD - extended address

Components: <street address (SAD)> ^ <other designation (ST)> ^ <city (ST)> ^ <state or province (ST)> ^ <zip or postal code (ST)> ^ <country (ID)> ^ < address type (ID)> ^ <other geographic designation (ST)> ^ <county/parish code (IS)> ^ <census tract (IS)> ^ <address representation code (ID)> ^ <address validity range (DR)>

Subcomponents of street address (SAD): <street or mailing address (ST)> & <street name (ST)> &
 <dwelling number (ST)>Subcomponents of address validity range (DR): <date range
 start date/time (TS)> & <date range end date/time (TS)>

Note: Replaces the AD data type as of v 2.3.

#### Length: 250

Example of usage for US:

|1234 Easy St. ^Ste. 123<br/>^San Franci $sco^{CA^95123^USA^B^^SF^}$ 

This would be formatted for postal purposes as

### 1234 Easy St.

Ste. 123

San Francisco CA 95123

Example of usage for Australia:

|14th Floor^50 Paterson St^Coorparoo^QLD^4151|

This would be formatted for postal purposes using the same rules as for the American example as

14th Floor 50 Paterson St

Coorparoo QLD 4151

International note: Countries typically have a standard method of formatting addresses. This data type does not specify the formatting usages, only the components of a postal address.

### 2.9.51.1 Street address (SAD)

See section 2.9.38, "SAD – street address" for description of components.

#### 2.9.51.2 Other designation (ST)

Second line of address. In US usage, it qualifies address. Examples: Suite 555 or Fourth Floor. When referencing an institution, this component specifies the street address.

## 2.9.51.3 City (ST)

This may be the name of the city, or district or place depending upon the national convention for formatting addresses for postal usage.

## 2.9.51.4 State or province (ST)

State or province should be represented by the official postal service codes for that country.

#### 2.9.51.5 Zip or postal code (ST)

Zip or postal codes should be represented by the official codes for that country. In the US, the zip code takes the form 99999[-9999], while the Canadian postal code takes the form A9A9A9, and the Australian Postcode takes the form 9999

## 2.9.51.6 Country (ID)

Defines the country of the address. ISO 3166 provides a list of country codes that may be used. The ISO 3166 table has three separate forms of the country code: HL7 specifies that the 3-character (alphabetic) form be used for the country code. <u>HL7 Table 0399 – Country code</u> is defined to contain these 3-character codes.

## 2.9.51.7 Address type (ID)

Address type is optional and defined by HL7 Table 0190 - Address type.

## 2.9.51.8 Other geographic designation (ST)

Other geographic designation includes county, bioregion, SMSA, etc.

## 2.9.51.9 County/parish code (IS)

A code that represents the county in which the specified address resides. <u>User-defined Table 0289 -</u> <u>County/parish</u> is used as the HL7 identifier for the user-defined table of values for this component. When this component is used to represent the county (or parish), component 8 <other geographic designation> should not duplicate it (i.e., the use of <other geographic designation> to represent the county is allowed only for the purpose of backward compatibility, and should be discouraged in this and future versions of HL7).

Allowable values: codes defined by government.

Page 2-72

User-defined Table 0289 - County/parish

| Value | Description                 |
|-------|-----------------------------|
|       | No suggested values defined |

## 2.9.51.10 Census tract (IS)

A code that represents the census tract in which the specified address resides. <u>User-defined Table 0288 -</u> <u>Census tract</u> is used as the HL7 identifier for the user-defined table of values for this component.

Allowable Values: codes defined by government.

User-defined Table 0288 – Census tract

| Value | Description                  |
|-------|------------------------------|
|       | No suggested values defined. |

## 2.9.51.11 Address representation code (ID)

Different <name/address types> and representations of the same name/address should be described by repeating of this field, with different values of the <name/address type> and/or <name/address representation> component.

**Note:** Also note that this new component remains in "alphabetic" representation with each repetition of the fields using these data types. I.e. even though the address may be represented in an ideographic character set, this component will remain represented in an alphabetic character set.

Refer to *HL7 table 0465 – Name/address representation* for valid values.

In general this component provides an indication of the representation provided by the data item. It does not necessarily specify the character sets used. Thus, even though the representation might provide an indication of what to expect, the sender is still free to encode the contents using whatever character set is desired. This component provides only hints for the receiver, so it can make choices regarding what it has been sent and what it is capable of displaying.

## 2.9.51.12 Address validity range (DR)

This component contains the start and end date/times which define the period in which this address was valid

2.9.51.12.1Date range start date/time (TS)

2.9.51.12.2Date range end date/time (TS)

## 2.9.52 XCN - extended composite ID number and name for persons

Components: <ID number (ST)> ^ <family name (FN)> ^ <given name (ST)> ^ <second and further given names or initials thereof (ST)> ^ <suffix (e.g., JR or III) (ST)> ^ <prefix (e.g., DR) (ST)> ^ <degree (e.g., MD) (IS)> ^ <source table (IS)> ^ <assigning authority (HD)> ^ <name type code (ID)> ^ <identifier check digit (ST)> ^ <code identifying the check digit scheme employed (ID)> ^ <identifier type code (IS)> ^ <assigning facility (HD)> ^ <name representation code (ID)> ^ <name context (CE)> ^ <name validity range (DR)> ^ <name assembly order (ID)>

Subcomponents of family name: <surname (ST)> & <own surname prefix (ST)> & <own surname (ST)> & <surname prefix from partner/spouse (ST)> & <surname from partner/spouse (ST)>

Subcomponents of assigning authority: <namespace ID (IS)> & <universal ID (ST)> & <universal ID type (ID)>

Note: Replaces CN data type as of v 2.3.

#### Length: 250

This data type is used extensively appearing in the PV1, ORC, RXO, RXE, OBR and SCH segments, as well as others, where there is a need to specify the ID number and name of a person.

Example without assigning authority and assigning facility:

|1234567^Smith^John^J^III^DR^PHD^ADT01^^L^4^M11^MR|

Examples with assigning authority and assigning facility:

Dr. Samuel Semmelweiss's provider ID was assigned by the Provider Master and was first issued at Fairview Hospital within the University Hospitals System. Since IS table values (first component of the HD) were not used for assigning authority and assigning facility, components 2 and 3 of the HD data type are populated and demoted to sub-components as follows:

12188^Semmel wei ss^Samuel ^S^IV^Dr^MD^^&Provi der Master. Uni versi ty Hospi tal s&L^L^9^M10^DN^&Fai rvi ew Hospi tal . Uni versi ty Hospi tal s&L^A

Ludwig van Beethoven's medical record number was assigned by the Master Patient Index and was first issued at Fairview Hospital within the University Hospitals System.

> 10535^van Beethoven&van^Ludwig^A^III^Dr^PHD^^&MPI. University Hospitals&L^L^3^MI0^MR^&Fairview Hospital. University Hospitals&L^A

#### 2.9.52.1 ID number (ST)

This string refers to the coded ID according to a user-defined table, defined by the 9<sup>th</sup> component. If the first component is present, either the source table or the assigning authority must be valued.

#### 2.9.52.2 Family name (FN)

This component allows full specification of the surname of a person. Where appropriate, it differentiates the person's own surname from that of the person's partner or spouse, in cases where the person's name may contain elements from either name. It also permits messages to distinguish the surname prefix (such as "van" or "de") from the surname root. See section 2.9.19, "FN - family name".

```
2.9.52.3 Given name (ST)
```

First name.

#### 2.9.52.4 Second and further given names or initials thereof (ST)

Multiple middle names may be included by separating them with spaces.

#### 2.9.52.5 Suffix (ST)

Used to specify a name suffix (e.g., Jr. or III).

## 2.9.52.6 Prefix (ST)

Used to specify a name prefix (e.g., Dr.).

## 2.9.52.7 Degree (IS)

Used to specify an educational degree (e.g., MD). Refer to <u>User-defined Table 0360 – Degree</u> for suggested values.

## 2.9.52.8 Source table (IS)

<u>User-defined Table 0297 – CN ID</u> source is used as the HL7 identifier for the user-defined table of values for this component. Used to delineate the first component.

## 2.9.52.9 Assigning authority (HD)

The assigning authority is a unique identifier of the system (or organization or agency of department) that creates the data. <u>User-defined Table 0363 – Assigning authority</u> is used as the HL7 identifier for the user-defined table of values for the first sub-component of the HD component, <namespace ID>.

**Note:** When the HD data type is used in a given segment as a component of a field of another data type, <u>User-defined</u> <u>Table 0300 - Namespace ID</u> (referenced by the first sub-component of the HD component) may be re-defined (given a different user-defined table number and name) by the technical committee responsible for that segment.

By site agreement, implementers may continue to use <u>User-defined Table 0300 – Namespace ID</u> for the first sub-component.

## 2.9.52.10 Name type code (ID)

A code that represents the type of name. Refer to <u>*HL7 Table 0200 - Name type*</u> for valid values (see Section 2.9.54.7, "Name type code (ID)").

## 2.9.52.11 Identifier check digit (ST)

The check digit in this data type is not an add-on produced by the message processor. It is the check digit that is part of the identifying number used in the sending application. If the sending application does not include a self-generated check digit in the identifying number, this component should be valued null.

## 2.9.52.12 Code identifying the check digit scheme employed (ID)

Refer to HL7 Table 0061 - Check digit scheme for valid values.

## 2.9.52.13 Identifier type code (IS)

A code corresponding to the type of identifier. In some cases, this code may be used as a qualifier to the <assigning authority> component. Refer to <u>HL7 Table 0203 - Identifier type</u> for suggested values.

## 2.9.52.14 Assigning facility (HD)

The place or location identifier where the identifier was first assigned to the person. This component is not an inherent part of the identifier but rather part of the history of the identifier: as part of this data type, its existence is a convenience for certain intercommunicating systems.

**Note:** When the HD data type is used in a given segment as a component of a field of another data type, <u>User-defined</u> <u>Table 0300 - Namespace ID</u> (referenced by the first sub-component of the HD component) may be re-defined (given a different user-defined table number and name) by the technical committee responsible for that segment.

## 2.9.52.15 Name representation code (ID)

Different <name/address types> and representations of the same <name/address> should be described by repeating of this field, with different values of the <name/address type> and/or <name/address representation> component.

**Note:** This new component remains in "alphabetic" representation with each repetition of the field using these data types. I.e.. even though the name may be represented in an ideographic character set, this component will remain represented in an alphabetic character set.

Refer to HL7 Table 0465 - Name/address representation for valid values.

In general this component provides an indication of the representation provided by the data item. It does not necessarily specify the character sets used. Thus, even though the representation might provide an indication of what to expect, the sender is still free to encode the contents using whatever character set is desired. This component provides only hints for the receiver, so it can make choices regarding what it has been sent and what it is capable of displaying.

## 2.9.52.16 Name context (CE)

This component is used to designate the context in which a name is used. The main use case is in Australian healthcare for indigenous patients who prefer to use different names when attending different healthcare institutions. Another use case occurs in the US where health practitioners can be licensed under slightly different names and the reporting of the correct name is vital for administrative purposes. Refer to <u>User-defined Table 0448 – Name context</u> for suggested values.

| Value | Description                 |
|-------|-----------------------------|
|       | No suggested values defined |

## 2.9.52.17 Name validity range (DR)

This component contains the start and end date/times that define the period during which this name was valid. See section 2.9.14, "DR - date/time range" for description of subcomponents.

#### 2.9.52.18 Name assembly order (ID)

A code that represents the preferred display order of the components of this person name. <u>*Refer to HL7*</u> <u>*Table 0444 – Name assembly order*</u> for valid values

## 2.9.53 XON - extended composite name and identification number for organizations

#### . .

This data type is used in fields (e.g., PV2-23, NK1-13, PD1-3, OBR-44) to specify the name and ID number of an organization.

Example 1:

The ID for Fairview Hospital was assigned by the University Hospital enterprise's Hospital Master and was first issued at the Central Offices.

Fairview Hospital ^L^716^9^M10^&Hospital Master. University Hositals&L^XX^&Central Offices. University Hospitals&L^A

Example 2:

Fairview Hospital has another ID that was issued by HCFA. Assigning Authority, HCFA, values only the first HD component, an IS data type and assigning facility is not relevant. This information might be transmitted accordingly:

Fairview Hospital ^L^4544^3^M10^HCFA^XX^^A

2.9.53.1 Organization name (ST)

The name of the specified organization.

## 2.9.53.2 Organization name type code (IS)

A code that represents the type of name i.e., legal name, display name. Refer to <u>User-defined Table 0204 -</u> <u>Organizational name type</u> for suggested values.

| Value | Description                 |
|-------|-----------------------------|
| A     | Alias name                  |
| L     | Legal name                  |
| D     | Display name                |
| SL    | Stock exchange listing name |

## User-defined Table 0204 - Organizational name type

## 2.9.53.3 ID number (NM)

## 2.9.53.4 Check digit (NM)

The check digit in this data type is <u>not</u> an add-on produced by the message processor. It is the check digit that is part of the identifying number used in the sending application. If the sending application does not include a self-generated check digit in the identifying number, this component should be valued null.

## 2.9.53.5 Code identifying the check digit scheme employed (ID)

The check digit scheme codes are defined in HL7 Table 0061 - Check digit scheme.

## 2.9.53.6 Assigning authority (HD)

The assigning authority is a unique identifier of the system (or organization or agency or department) that creates the data. Assigning authorities are unique across a given HL7 implementation. <u>User-defined Table</u> <u>0363 – Assigning authority</u> is used as the HL7 identifier for the user-defined table of values for the first sub-component of the HD component <namespace ID>.

Health Level Seven, Version 2.4 © 2000. All rights reserved.

**Note:** When the HD data type is used in a given segment as a component of a field of another data type, <u>User-defined</u> <u>Table 0300 - Namespace ID</u> (referenced by the first sub-component of the HD component) may be re-defined (given a different user-defined table number and name) by the technical committee responsible for that segment.

By site agreement, implementors may continue to use <u>User-defined Table 0300 – Namespace ID</u> for the first sub-component.

## 2.9.53.7 Identifier type code (IS)

A code corresponding to the type of identifier. In some cases, this code may be used as a qualifier to the "Assigning authority" component. Refer to <u>HL7 Table 0203 - Identifier type</u> for suggested values.

#### 2.9.53.8 Assigning facility ID (HD)

The place or location identifier where the identifier was first assigned to the person. This component is not an inherent part of the identifier but rather part of the history of the identifier: as part of this data type, its existence is a convenience for certain intercommunicating systems.

**Note:** When the HD data type is used in a given segment as a component of a field of another data type, <u>User-defined</u> <u>Table 0300 - Namespace ID</u> (referenced by the first sub-component of the HD component) may be re-defined (given a different user-defined table number and name) by the technical committee responsible for that segment.

## 2.9.53.9 Name representation code (ID)

Different <name/address types> and representations of the same <name/address> should be described by repeating of this field, with different values of the <name/address type> and/or <name/address representation> component.

Note: This new component remains in "alphabetic" representation with each repetition of the field using these data types, i.e. even though the name may be represented in an ideographic character set, this component will remain represented in an alphabetic character set.

Refer to HL7 Table 0465 - Name/address representation code for valid values.

In general this component provides an indication of the representation provided by the data item. It does not necessarily specify the character sets used. Thus, even though the representation might provide an indication of what to expect, the sender is still free to encode the contents using whatever character set is desired. This component provides only hints for the receiver, so it can make choices regarding what it has been sent and what it is capable of displaying.

## 2.9.54 XPN - extended person name

Length: 250

Note: Replaces PN data type as of v 2.3.

Example:

|Smith^John^J^III^DR^PHD^L|

## 2.9.54.1 Family name (FN)

This component allows full specification of the surname of a person. Where appropriate, it differentiates the person's own surname from that of the person's partner or spouse, in cases where the person's name may contain elements from either name. It also permits messages to distinguish the surname prefix (such as "van" or "de") from the surname root. See section 2.9.19, "FN - family name".

## 2.9.54.2 Given name (ST)

First name.

## 2.9.54.3 Second and further given names or initials thereof (ST)

Multiple middle names may be included by separating them with spaces.

## 2.9.54.4 Suffix (ST)

Used to specify a name suffix (e.g., Jr. or III).

## 2.9.54.5 Prefix (ST)

Used to specify a name prefix (e.g., Dr.).

## 2.9.54.6 Degree (IS)

Used to specify an educational degree (e.g., MD). Refer to <u>User-defined Table 0360 – Degree</u> for suggested values.

| Value | Description                          |
|-------|--------------------------------------|
| AAS   | Associate of Applied Science         |
| AA    | Associate of Arts                    |
| ABA   | Associate of Business Administration |
| AE    | Associate of Engineering             |
| AS    | Associate of Science                 |
| BA    | Bachelor of Arts                     |
| BBA   | Bachelor of Business Administration  |
| BE    | Bachelor or Engineering              |
| BFA   | Bachelor of Fine Arts                |
| BN    | Bachelor of Nursing                  |
| BS    | Bachelor of Science                  |
| BSL   | Bachelor of Science – Law            |
| BT    | Bachelor of Theology                 |
| CER   | Certificate                          |
| DIP   | Diploma                              |

## User-defined Table 0360 - Degree

Health Level Seven, Version 2.4 © 2000. All rights reserved.

| Value  | Description                       |
|--------|-----------------------------------|
| DBA    | Doctor of Business Administration |
| DED    | Doctor of Education               |
| PharmD | Doctor of Pharmacy                |
| PHE    | Doctor of Engineering             |
| PHD    | Doctor of Philosophy              |
| PHS    | Doctor of Science                 |
| MD     | Doctor of Medicine                |
| DO     | Doctor of Osteopathy              |
| HS     | High School Graduate              |
| JD     | Juris Doctor                      |
| MA     | Master of Arts                    |
| MBA    | Master of Business Administration |
| MCE    | Master of Civil Engineering       |
| MDI    | Master of Divinity                |
| MED    | Master of Education               |
| MEE    | Master of Electrical Engineering  |
| ME     | Master of Engineering             |
| MFA    | Master of Fine Arts               |
| MME    | Master of Mechanical Engineering  |
| MS     | Master of Science                 |
| MSL    | Master of Science – Law           |
| MT     | Master of Theology                |
| NG     | Non-Graduate                      |
| SEC    | Secretarial Certificate           |
| TS     | Trade School Graduate             |

## 2.9.54.7 Name type code (ID)

A code that represents the type of name. Refer to <u>HL7 Table 0200 - Name type</u> for valid values.

| Value | Description    |
|-------|----------------|
| A     | Alias Name     |
| В     | Name at Birth  |
| С     | Adopted Name   |
| D     | Display Name   |
| I     | Licensing Name |
| L     | Legal Name     |
| М     | Maiden Name    |

## HL7 Table 0200 - Name type

| Value | Description                                                       |
|-------|-------------------------------------------------------------------|
| N     | Nickname /"Call me" Name/Street Name                              |
| Р     | Name of Partner/Spouse (retained for backward compatibility only) |
| R     | Registered Name (animals only)                                    |
| S     | Coded Pseudo-Name to ensure anonymity                             |
| Т     | Indigenous/Tribal/Community Name                                  |
| U     | Unspecified                                                       |

**Note:** The content of Legal Name is country specific. In the US the legal name is the same as the current married name.

## 2.9.54.8 Name representation code (ID)

Different <name/address types> and representations of the same <name/address> should be described by repeating of this field, with different values of the <name/address type> and/or <name/address representation> component.

**Note:** This new component remains in "alphabetic" representation with each repetition of the field using these data types. I.e. even though the name may be represented in an ideographic character set, this component will remain represented in an alphabetic character set.

Refer to HL7 Table 0465 - Name/address representation for valid values.

In general this component provides an indication of the representation provided by the data item. It does not necessarily specify the character sets used. Thus, even though the representation might provide an indication of what to expect, the sender is still free to encode the contents using whatever character set is desired. This component provides only hints for the receiver, so it can make choices regarding what it has been sent and what it is capable of displaying.

#### 2.9.54.9 Name context (CE)

This component is used to designate the context in which a name is used. The main use case is in Australian healthcare for indigenous patients who prefer to use different names when attending different healthcare institutions. Another use case occurs in the US where health practitioners can be licensed under slightly different names and the reporting of the correct name is vital for administrative purposes. Refer to <u>User-defined Table 0448 – Name context</u> for suggested values.

#### 2.9.54.10 Name validity range (DR)

This component contains the start and end date/times which define the period during which this name was valid. See section 2.9.14, "DR - date/time range" for description of subcomponents.

#### 2.9.54.11 Name assembly order (ID)

A code that represents the preferred display order of the components of this person name. Refer to HL7 0444 – Name assembly order for valid values.

## 2.9.55 XTN - extended telecommunication number

Components: [NNN] [(999)]999-9999 [X99999] [B99999] [C any text] ^ <telecommunication use code (ID)> ^ <telecommunication equipment type (ID)> ^ <email address (ST)> ^ <country

```
code (NM)> ^ <area/city code (NM)> ^ <phone number (NM)> ^ <extension (NM)> ^ <any text (ST)> \label{eq:mass}
```

Note: Replaces TN data type as of v 2.3

Length: 250

Example:

(415) 555-3210^0RN^FX^

## 2.9.55.1 [(999)] 999-9999 [X99999] [C any text]

Defined as the TN data type (see Section 2.9.45, "TN - telephone number"), except that the length of the country access code has been increased to three.

#### 2.9.55.2 Telecommunication use code (ID)

A code that represents a specific use of a telecommunication number. Refer to <u>HL7 Table 0201 - Telecom-</u> <u>munication use code</u> for valid values.

| Value | Description              |
|-------|--------------------------|
| PRN   | Primary Residence Number |
| ORN   | Other Residence Number   |
| WPN   | Work Number              |
| VHN   | Vacation Home Number     |
| ASN   | Answering Service Number |
| EMR   | Emergency Number         |
| NET   | Network (email) Address  |
| BPN   | Beeper Number            |

HL7 Table 0201 - Telecommunication use code

2.9.55.3 Telecommunication equipment type (ID)

A code that represents the type of telecommunication equipment. Refer to <u>HL7 Table 0202 - Telecommuni-</u> cation equipment type for valid values.

| Value    | Description                                                        |
|----------|--------------------------------------------------------------------|
| PH       | Telephone                                                          |
| FX       | Fax                                                                |
| MD       | Modem                                                              |
| СР       | Cellular Phone                                                     |
| BP       | Beeper                                                             |
| Internet | Internet Address: Use Only If Telecommunication Use Code Is NET    |
| X.400    | X.400 email address: Use Only If Telecommunication Use Code Is NET |

HL7 Table 0202 - Telecommunication equipment type

## 2.9.55.4 Email address (ST)

| Interna | <b>tionalization note:</b> To make this data type interoperate with CEN's Telecommunication data attribute group, we allow use of the second component for email addresses. The presence of an email address is specified by the addition of the value <i>NET</i> to the Phone Use Code table, and the type of Internet address is specified with the values <i>Internet</i> and <i>X.400</i> to the Phone Equipment Type table. When used for an Internet address, the first component of the XTN data type will be null. If the @-sign is being used as a subcomponent delimiter, the HL7 subcomponent escape sequence may be used when encoding an Internet address (see Section 2.10.1, "Formatting codes"). |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Note:   | Components five through nine reiterate the basic function of the first component in a delimited form that allows the expression of both local and international telephone numbers. In Version 2.3, the recommended form for the telephone number is to use the delimited form rather than the unstructured form supported by the first component (which is left in for backward compatibility only).                                                                                                                                                                                                                                                                                                             |

# 2.10 USE OF ESCAPE SEQUENCES IN TEXT FIELDS

## 2.10.1 Formatting codes

When a field of type TX, FT, or CF is being encoded, the escape character may be used to signal certain special characteristics of portions of the text field. The escape character is whatever display ASCII character is specified in the <escape character> component of *MSH-2-encoding characters*. For purposes of this section, the character \ will be used to represent the character so designated in a message. An **escape sequence** consists of the escape character followed by an escape code ID of one character, zero (0) or more data characters, and another occurrence of the escape character. The following escape sequences are defined:

| $ \mathbf{H} $               | start highlighting              |
|------------------------------|---------------------------------|
| N                            | normal text (end highlighting)  |
| \F\                          | field separator                 |
| S                            | component separator             |
| \T\                          | subcomponent separator          |
| $\langle \mathbf{R} \rangle$ | repetition separator            |
| \E\                          | escape character                |
| Xdddd                        | hexadecimal data                |
| Zdddd                        | locally defined escape sequence |
|                              |                                 |

The **escape sequences** for field separator, component separator, subcomponent separator, repetition separator, and escape character are also valid within an ST data field.

No escape sequence may contain a nested escape sequence.

# 2.10.2 Escape sequences supporting multiple character sets for, FT, ST, and TX data types

The following HL7 escape sequences are defined to support multiple character sets for fields, components and sub-components that are defined as data types FT, ST, and TX. They allow HL7 parsers to use escape codes (defined in the standards used below), without breaking, and without being non-conformant to the HL7 escape paradigm defined in this section.

- \Cxxyy\ single-byte character set escape sequence with two hexadecimal values, xx and yy, that indicate the escape sequence defined for one of the character repertoires supported for the current message (i.e., ISO-IR xxx).
- \Mxxyyzz\ multi-byte character set escape sequence with three hexadecimal values, xx, yy and zz. zz is optional.

Common character set escape sequences include the following which are defined in the standards mentioned:

Single-byte character sets:

| \C2842\           | ISO-IR6 G0 (ISO 646 : ASCII)                         |  |
|-------------------|------------------------------------------------------|--|
| C2D41             | ISO-IR100 (ISO 8859 : Latin Alphabet 1)              |  |
| C2D42             | ISO-IR101 (ISO 8859 : Latin Alphabet 2)              |  |
| \C2D43\           | ISO-IR109 (ISO 8859 : Latin Alphabet 3)              |  |
| C2D44             | ISO-IR110 (ISO 8859 : Latin Alphabet 4)              |  |
| \C2D4C\           | ISO-IR144 (ISO 8859 : Cyrillic)                      |  |
| C2D47             | ISO-IR127 (ISO 8859 : Arabic)                        |  |
| \C2D46\           | ISO-IR126 (ISO 8859 : Greek)                         |  |
| \C2D48\           | ISO-IR138 (ISO 8859 : Hebrew)                        |  |
| C2D4D             | ISO-IR148 (ISO 8859 : Latin Alphabet 5)              |  |
| \C284A\           | ISO-IR14 (JIS X 0201 -1976: Romaji)                  |  |
| \C2949\           | ISO-IR13 (JIS X 0201 : Katakana)                     |  |
| Multi-byte codes: |                                                      |  |
| \M2442\           | ISO-IR87 (JIS X 0208 : Kanji, hiragana and katakana) |  |
| M242844           | ISO-IR159 (JIS X 0212 : Supplementary Kanji)         |  |

Page 2-84

## 2.10.3 Highlighting

In designating highlighting, the sending application is indicating that the characters that follow somehow should be made to stand out, but leaving the method of doing so to the receiving application. Depending on device characteristics and application style considerations, the receiving application may choose reverse video, boldface, underlining, blink, an alternate color or another means of highlighting the displayed data. For example the message fragment:

DSP | TOTAL CHOLESTEROL  $H\240*\N$  [90 - 200]

might cause the following data to appear on a screen or report:

TOTAL CHOLESTEROL 240\* [90 - 200]

whereas another system may choose to show the 240\* in red.

## 2.10.4 Special character

The special character escape sequences ( $\langle F \rangle$ ,  $\langle S \rangle$ ,  $\langle R \rangle$ ,  $\langle T \rangle$ , and  $\langle E \rangle$ ) allow the corresponding characters to be included in the data in a text field, though the actual characters are reserved. For example, the message fragment

 DSP|
 TOTAL CHOLESTEROL
 180
 F\90
 200\F\

 DSP|
 \S\------\S\

would cause the following information to be displayed, given suitable assignment of separators:

 TOTAL CHOLESTEROL
 180
 90 - 200

 ^----- ^

## 2.10.5 Hexadecimal

When the hexadecimal escape sequence (Xdddd...) is used the X should be followed by 1 or more pairs of hexadecimal digits (0, 1, ..., 9, A, ..., F). Consecutive pairs of the hexadecimal digits represent 8-bit binary values. The interpretation of the data is entirely left to an agreement between the sending and receiving applications that is beyond the scope of this Standard.

## 2.10.6 Formatted text

If the field is of the formatted text (FT) data type, formatting commands also may be surrounded by the escape character. Each command begins with the . (period) character. The following formatting commands are available:

| .sp <number></number> | End current output line and skip <number> vertical spaces. <number> is a positive integer or absent. If <number> is absent, skip one space. The horizontal character position remains unchanged. Note that for purposes of compatibility with previous versions of HL7, "^\.sp\" is equivalent to "\.br\."</number></number></number> |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| .br                   | Begin new output line. Set the horizontal position to the current left margin and increment the vertical position by 1.                                                                                                                                                                                                               |
| .fi                   | Begin word wrap or fill mode. This is the default state. It can be changed to a no-wrap mode using the .nf command.                                                                                                                                                                                                                   |
| .nf                   | Begin no-wrap mode.                                                                                                                                                                                                                                                                                                                   |

| .in <number></number> | Indent <number> of spaces, where <number> is a positive or negative integer. This command cannot appear after the first printable character of a line.</number></number> |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| .ti <number></number> | Temporarily indent <number> of spaces where number is a positive or negative integer. This command cannot appear after the first printable character of a line.</number> |
| .sk < number>         | Skip <number> spaces to the right.</number>                                                                                                                              |
| .ce                   | End current output line and center the next line.                                                                                                                        |

The component separator that marks each line defines the extent of the temporary indent command (.ti), and the beginning of each line in the no-wrap mode (.nf). Examples of formatting instructions that are NOT included in this data type include: width of display, position on page or screen, and type of output devices.

Figure 2-3 is an example of the FT data type from a radiology impression section of a radiology report:

Figure 2-3. Formatted text as transmitted

Figure 2-4 shows one way of presenting the data in Figure 2-3. The receiving system can create many other interpretations by varying the right margin.

Figure 2-4. Formatted text in one possible presentation

```
    The cardiomediastinal silhouette is now within normal limits.
    Lung fields show minimal ground glass appearance.
    A loop of colon visible in the left upper quadrant is distinctly abnormal with the appearance of mucosal effacement suggesting colitis.
```

## 2.10.7 Local

When the local escape sequence (\Zdddd...\) is used the Z should be followed by characters that are valid in a TX field. The interpretation of the data is entirely left to an agreement between the sending and receiving applications that is beyond the scope of this Standard.

# 2.11 MESSAGE CONSTRUCTION RULES

**Note:** These message construction rules define the standard HL7 encoding rules, creating variable length delimited messages. Although only one set of encoding rules is defined as a standard in HL7 Version 2.3, other encoding rules are possible (but since they are non-standard, they may only be used by a site-specific agreement).

- Step 1 Construct the segments in the order defined for the message. Each message is constructed as follows:
  - a) the first three characters are the segment ID code
  - b) each data field in sequence is inserted in the segment in the following manner:
    - 1) a field separator is placed in the segment
    - 2) if the value is not present, no further characters are required

- 3) if the value is present, but null, the characters "" (two consecutive double quotation marks) are placed in the field
- 4) otherwise, place the characters of the value in the segment. As many characters can be included as the maximum defined for the data field. It is not necessary, and is undesirable, to pad fields to fixed lengths. Padding to fixed lengths is permitted. Encode the individual data fields as shown in Section 2.9, "Data types."
- 5) if the field definition calls for a field to be broken into components, the following rules are used:
  - i. if more than one component is included they are separated by the component separator
  - ii. components that are present but null are represented by the characters ""
  - iii. components that are not present are treated by including no characters in the component
  - iv. components that are not present at the end of a field need not be represented by component separators. For example, the two data fields are equivalent:

|ABC^DEF^^| and |ABC^DEF|.

- 6) if the component definition calls for a component to be broken into subcomponents, the following rules are used:
  - i. if more than one subcomponent is included they are separated by the subcomponent separator
  - ii. subcomponents that are present but null are represented by the characters ""
  - iii. subcomponents that are not present are treated by including no characters in the subcomponent
  - iv. subcomponents that are not present at the end of a component need not be represented by subcomponent separators. For example, the two data components are equivalent:

#### ^XXX&YYY&&^ and ^XXX&YYY^.

7) if the field definition permits repetition of a field, the repetition separator is used only if more than one occurrence is transmitted. In such a case, the repetition separator is placed between occurrences. If three occurrences are transmitted, two repetition separators are used.)

In the example below, two occurrences of telephone number are being sent:

## |234-7120~599-1288B1234|

- c) repeat Step 1b while there are any fields present to be sent. If all the data fields remaining in the segment definition are not present there is no requirement to include any more delimiters.
- d) end each segment with an ASCII carriage return character

Step 2 Repeat Step 1 until all segments have been generated.

The following rules apply to receiving HL7 messages and converting their contents to data values:

- a) ignore segments, fields, components, subcomponents, and extra repetitions of a field that are present but were not expected
- b) treat segments that were expected but are not present as consisting entirely of fields that are not present
- c) treat fields and components that are expected but were not included in a segment as not present.

## 2.11.1 Encoding rules notes

If a segment is to be continued across messages, use the extended encoding rules. These rules are defined in terms of the more general message continuation protocol (see Section 2.15.2, "Continuation messages and segments").

Health Level Seven, Version 2.4 © 2000. All rights reserved.

## 2.11.2 Version compatibility definition

The above rules for receiving HL7 messages and converting their contents to data values allow the following definition of a backward compatibility requirement between the 2.x versions of HL7:

- a) New messages may be introduced.
- b) New segments may be introduced to an existing message. In general these will be introduced at the end of a message, but they may be introduced elsewhere within the message if the segment hierarchy makes this necessary.
- c) New fields may be added at the end of a segment, new components may be added at the end of a field, new subcomponents may be added at the end of a component, and a non-repeating field may be made repeating.
- d) Existing optional segments, fields, components, and subcomponents may be made conditional or required.

If a non-repeating field is made repeating, the first instance of that repeating field must have the same meaning as the non-repeating field had in the prior version of HL7.

For existing fields in existing segments, data types may be changed by the above rule in point "c" if the leftmost (prior version) part of the field has the same meaning as it had in the prior version of HL7. In other words, if the new parts of the field (those that are part of the new data type) are ignored, what remains is the old field (defined by the old data type), which has the same meaning as it had in the prior version of HL7. When optional elements are made required or conditional, what remains for older versions is not changed.

# 2.12 CHAPTER FORMATS FOR DEFINING HL7 MESSAGES

Subsequent chapters of this document describe messages that are exchanged among applications in functionally-specific situations. Each chapter is organized as follows:

- a) purpose. This is an overview describing the purpose of the chapter, general information and concepts.
- b) **trigger events and messages**. There is a list of the trigger events. For each trigger event the messages that are exchanged when the trigger event occurs are defined using the HL7 abstract message syntax as follows:

Each message is defined in special notation that lists the segment IDs in the order they would appear in the message. Braces,  $\{ \dots \}$ , indicate one or more repetitions of the enclosed group of segments. (Of course, the group may contain only a single segment.) Brackets,  $[ \dots ]$ , show that the enclosed group of segments is optional. If a group of segments is optional and may repeat it should be enclosed in brackets and braces,  $\{ \dots \}$ .

| Note: | [{}] and {[]} are equivalent. |
|-------|-------------------------------|
|-------|-------------------------------|

Whenever braces or brackets enclose more than one segment ID a special stylistic convention is used to help the reader understand the hierarchy of repetition. For example, the first segment ID appears on the same line as the brace, two columns to the right. The subsequent segment IDs appear under the first. The closing brace appears on a line of its own in the same column as the opening brace. This convention is an optional convenience to the user. If there is conflict between its use and the braces that appear in a message schematic, the braces define the actual grouping of segments that is permitted.

A choice of one segment from a group of segments is indicated by using angle brackets to delimit the group and vertical bar delimiters between the several segments.

Example: The ORM^O01, as described in chapter 4 section 4.4.1, allows a choice of order detail segments. The choice would be represented as follows:

 $<\!\!OBR\,|\,RQD\,|\,RQ1\,|\,RXO\,|\,ODS\,|\,ODT\!>$ 

- c) **message segments**. The segments defined in a chapter are then listed in a functional order designed to maximize conceptual clarity.
- d) examples. Complete messages are included.
- e) **implementation considerations**. Special supplementary information is presented here. This includes issues that must be addressed in planning an implementation.
- f) outstanding issues. Issues still under consideration or requiring consideration are listed here.

Consider the hypothetical triggering event **a widget report is requested**. It might be served by the Widget Request (WRQ) and Widget Report (WRP) messages. These would be defined in the Widget chapter (say Chapter XX). The Widget Request message might consist of the following segments: Message Header (MSH), Widget ID (WID). The Widget Report message might consist of the following segments: Message Header (MSH), Message acknowledgment (MSA), one or more Widget Description (WDN) Segments each of which is followed by a single Widget Portion segment (WPN) followed by zero or more Widget Portion Detail (WPD) segments.

## 2.12.1 HL7 abstract message syntax example

The schematic form for this hypothetical exchange of messages is shown in Figure 2-5:

## Trigger Event: WIDGET REPORT IS REQUESTED

| WRQ          | Widget Request         | Chapter |
|--------------|------------------------|---------|
| MSH          | Message Header         | 2       |
| WID          | Widget ID              | XX      |
| WRP          | Widget Report          | Chapter |
| MSH          | Message Header         | 2       |
|              | Message Acknowledgment | 2       |
| MSA          | hebbage hennewieagment | 2       |
| MSA<br>{ WDN | Widget Description     | XX      |

The WID, WDN, WPN, and WPD segments would be defined by the widget committee in the widget chapter, as designated by the Arabic numeral XX in the right column. The MSH and MSA segments, although included in the widget messages, are defined in another chapter. They are incorporated by reference into the widget chapter by the chapter number XX.

On the other hand, the widget committee might decide that the WPN and WPD segments should appear in pairs, but the pairs are optional and can repeat. Then the schematic for the WRP message would be as shown in Figure 2-6.

| Figure 2-6. | WPN and | WPD | segments   | in | pairs |
|-------------|---------|-----|------------|----|-------|
|             |         |     | Segurence. |    | Puno  |

| WRF     | Widget Report          | Chapter |
|---------|------------------------|---------|
| MSH     | Message Header         | 2       |
| MSA     | Message Acknowledgment | 2       |
| { WDN   | Widget Description     | XX      |
| [ { WPN | Widget Portion         | XX      |
| WPD     | Widget Portion Detail  | XX      |
| } ]     |                        |         |
| }       |                        |         |

If the widget committee determined that at least one pair of WPN and WPD segments must follow a WDN, then the notation would be as shown in Figure 2-7.

| WRP        | Widget Report          | Chapter |
|------------|------------------------|---------|
| MSH        | Message Header         | 2       |
| MSH<br>MSA | Message Acknowledgment | 2       |
| { WDN      | Widget Description     | XX      |
| { WPN      | Widget Portion         | XX      |
| WPD        | Widget Portion Detail  | XX      |
| }          |                        |         |
| }          |                        |         |

Figure 2-7. At least one pair of WPN and WPD

# 2.13 APPLICATION (LEVEL 7) PROCESSING RULES

## 2.13.1 Original and enhanced processing rules

The processing rules described here apply to all exchanges of messages, whether or not the HL7 encoding rules or Lower Layer Protocols are used. They represent the primary message processing mode. Certain variants are documented in Section 2.13.2, "Application (level 7) processing rules, deferred processing two phase reply (original acknowledgment mode only)." These include:

- a) the application processing rules for a special processing mode, deferred processing. This mode remains in the specification only for backward compatibility.
- b) an optional sequence number protocol
- c) an optional protocol for continuing a very long message

The processing rules were extended in Version 2.2 of the Standard. The extensions provide a greater degree of flexibility in the way that messages can be acknowledged, as specified by several new fields in the Message Header segment. To provide backward compatibility with prior versions, the absence of these fields implies that the extended processing rules are not used. In the remainder of this section the extended mode is called the enhanced acknowledgment mode; the prior version is called the original acknowledgment mode.

Because the protocol describes an exchange of messages, it is described in terms of two entities, the initiating and responding systems. Each is both a sender and receiver of messages. The initiating system sends first and then receives, while the responding system receives and then sends.

In overview this exchange proceeds as follows:

Step 1 the initiating system constructs an HL7 message from application data and sends it to the responding system

- Step 2 responder receives message and
- 2.1 when the original acknowledgment rules apply:
  - a) validates the message syntactically and against the detailed rules described in Section 2.13.1.2.1, If it fails, a reject message is constructed by the protocol software and returned to the initiator; if it does not fail, continue to the next step (2.1,b)
  - b) passes the message to the application, which:
    - 1) creates a response message, or
    - 2) creates an error message, or
    - 3) creates a reject message
  - c) sends the response, error, or reject message

Initiator passes the message to the initiating application.

2.2 when enhanced acknowledgment rules apply:

See section 2.13.1.2.2

- a) the responding system receives the message and commits it to safe storage. This means that the responding system accepts the responsibility for the message in a manner that releases the sending system from any obligation to resend the message. The responding system now checks the message header record to determine whether or not the initiating system requires an accept acknowl-edgment message indicating successful receipt and secure storage of the message. If it does, the accept acknowledgment message is constructed and returned to the initiator.
- b) at this point, the requirements of the applications involved in the interface determine whether or not more information needs to be exchanged. This exchange is referred to as an application acknowledgment and includes information ranging from simple validation to a complex applicationdependent response. If the receiving system is expected to return application-dependent information, it initiates another exchange when this information is available. This time, the roles of initiator and responder are reversed.

The details follow.

## 2.13.1.1 Initiation

The initiating application creates a message with data values as defined in the appropriate chapter of this Standard. The fields shown below should be valued in the MSH segment (as defined under the MSH segment definition of this chapter). The message is encoded according to the applicable rules and sent to the lower level protocols, which will attempt to deliver it to the responding application. (For definitions of the MSH fields see Section 2.16.9, "MSH - message header segment")

| Field                       | Notes                                                                                                                                  |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| MSH-3-sending application   |                                                                                                                                        |
| MSH-4-sending facility      |                                                                                                                                        |
| MSH-5-receiving application |                                                                                                                                        |
| MSH-6-receiving facility    |                                                                                                                                        |
| MSH-7-date/time of message  |                                                                                                                                        |
| MSH-9-message type          |                                                                                                                                        |
| MSH-10-message control ID   | Unique identifier used to relate the response to the initial message.                                                                  |
| MSH-11-processing ID        |                                                                                                                                        |
| MSH-12-version ID           |                                                                                                                                        |
| MSH-13-sequence number      |                                                                                                                                        |
| MSH-14-continuation pointer | Used in implementation of message continuation protocol. See Section 2.15.2, "Continuation messages and segments". Also see chapter 5. |

Certain other fields in the MSH segment are required for the operation of the HL7 encoding rules; they will not be relevant if other encoding rules are employed.

The event code in the second component of *MSH-9-message type* is redundantly shown elsewhere in some messages. For example, the same information is in the EVN segment of the ADT message. This is for

Health Level Seven, Version 2.4 © 2000. All rights reserved.

compatibility with prior versions of the HL7 protocol. Newly-defined messages should only show the event code in *MSH-9-message type*.

## 2.13.1.2 Response

The protocol software in the responding system does one of the following:

#### 2.13.1.2.1 When the original acknowledgment rules apply

| Note: | Both MSH-15-accept acknowledgment type and MSH-16-application acknowledgment type are null or not |
|-------|---------------------------------------------------------------------------------------------------|
|       | present.                                                                                          |
|       |                                                                                                   |

- a) accepts the message
- b) validates it against at least the following criteria:
  - 1) the value in *MSH-9-message type* is one that is acceptable to the receiver
  - 2) the value in MSH-12-version ID is acceptable to the receiver
  - 3) the value in MSH-11-processing ID is appropriate for the application process handling the message

If any of these edits fail, the protocol software rejects the message. That is, it creates an ACK message with **AR** in *MSA-1-acknowledgment code*.

c) if the message passes the edits, the message is passed to the receiving application, which performs one of these functions:

1) process the message successfully, generating the functional response message with a value of **AA** in *MSA-1-acknowledgment code*.

-OR-

2) send an error response, providing error information in functional segments to be included in the response message with a value of **AE** in *MSA-1-acknowledgment code*.

#### -OR-

- 3) fail to process (reject) the message for reasons unrelated to its content or format (system down, internal error, etc.). For most such problems it is likely that the responding system will be able to accept the same message at a later time. The implementers must decide on an application-specific basis whether the message should be automatically sent again. The response message contains a value of AR in MSA-1-acknowledgment code.
- d) passes the message to the initiating system
- e) the protocol software in the initiating system passes the response message to the initiating application

In all the responses described above the following values are put in the MSA segment. Note that the field definitions for the MSA segment fields are in Section 2.16.8, "MSA - message acknowledgment segment":

| Field                          | Notes                                                                                                        |
|--------------------------------|--------------------------------------------------------------------------------------------------------------|
| MSA-1-acknowledgment code      | As described above.                                                                                          |
| MSA-2-message control ID       | MSH-10-message control ID from MSH segment of incoming message.                                              |
| MSA-3-text message             | Text description of error.                                                                                   |
| MSA-4-expected sequence number | As described in Section 2.15.1, "Sequence number protocol," (if the sequence number protocol is being used). |
| MSA-5-delayed acknowledgment   | For use only as described in Section Application (level                                                      |

Health Level Seven, Version 2.4 © 2000. All rights reserved.

| type | 7) processing rules, deferred processing two phase reply |
|------|----------------------------------------------------------|
|      | (original acknowledgment mode only)."                    |

The MSH segment in the response is constructed anew following the rules used to create the initial message described above. In particular, *MSH-7-date/time of message* and *MSH-10-message control ID* refer to the response message; they are not echoes of the fields in the initial message. *MSH-5-receiving application, MSH-6-receiving facility*, and *MSH-11-processing ID* contain codes that are copied from *MSH-3-sending application, MSH-4-sending facility* and *MSH-11-processing ID* in the initiating message.

## 2.13.1.2.2 When enhanced acknowledgment rules apply

**Note:** At least one of MSH-15-accept acknowledgment type or MSH-16-application acknowledgment type is not null.

- a) accepts the message
- b) makes an initial determination as to whether or not the message can be accepted, based on factors such as:
  - 1) the status of the interface
  - 2) the availability of safe storage onto which the message can be saved
  - 3) the syntactical correctness of the message, if the design of the receiving system includes this type of validation at this phase
  - 4) the values of *MSH-9-message type*, *MSH-12-version ID*, and *MSH-11-processing ID*, if the design of the receiving system includes this type of validation at this phase

c) examines the Message Header segment (MSH) to determine whether or not the initiating system requires an accept acknowledgment.

If it does, the responding system returns a general acknowledgment message (ACK) with:

- 1) a commit accept (CA) in *MSA-1-acknowledgment code* if the message can be accepted for processing
- 2) a commit reject (CR) in *MSA-1-acknowledgment code* if the one of the values of *MSH-9-message type*, *MSH-12-version ID* or *MSH-11-processing ID* is not acceptable to the receiving application
- 3) a commit error (CE) in *MSA-1-acknowledgment code* if the message cannot be accepted for any other reason (e.g., sequence number error)

For this response, the following values are put in the MSA segment. Note that the field definitions for the MSA segment fields are in Section 2.16.8, "MSA - message acknowledgment segment":

| Field                          | Notes                                                                                                       |
|--------------------------------|-------------------------------------------------------------------------------------------------------------|
| MSA-2-message control ID       | MSH-10-message control ID from the incoming message.                                                        |
| MSA-1-acknowledgment code      | As described above.                                                                                         |
| MSA-3-text message             | Text description of error.                                                                                  |
| MSA-4-expected sequence number | As described in Section 2.15.1, "Sequence number protocol" (if the sequence number protocol is being used). |

The MSH segment in the response is constructed anew following the rules used to create the initial message described above. In particular, *MSH-7-date/time of message* and *MSH-10-message control ID* refer to the response message; they are not echoes of the fields in the initial message. *MSH-5-receiving application, MSH-6-receiving facility*, and *MSH-11-processing ID* contain codes that are copied from *MSH-3-sending application, MSH-4-sending facility* and *MSH-11-processing ID* in the initiating message.

Health Level Seven, Version 2.4 © 2000. All rights reserved.

**Note:** MSH-15-accept acknowledgment type and MSH-16-application acknowledgment type are not valued (not present or null). At this point, the accept portion of this message exchange is considered complete.

d) If the message header segment indicates that the initiating system also requires an application acknowledgment, this will be returned as the initial message of a later exchange.

For this response, the following values are put in the MSA segment. Note that the field definitions for the MSA segment fields are in Section 2.16.8, "MSA - message acknowledgment segment":

| Field                     | Notes                                                                                                                                     |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| MSA-2-message control ID  | Identifies the initial message from the original initiating system as defined in Section 2.13.1.1, "Initiation".                          |
| MSA-1-acknowledgment code | Uses the application (processing) acknowledgment codes as described in Section 2.13.1.2.1, "When the original acknowledgment rules apply" |
| MSA-3-text message        | Text description of error.                                                                                                                |

For this message, the receiving system acts as the initiator. Since the message it sends is application-specific, the layouts of these application-level response messages are defined in the relevant application-specific chapter. If needed, this application acknowledgment message can itself require (in *MSH-15accept acknowledgment type*) an accept acknowledgment message (MSA). *MSH-16-application acknowledgment type*, however, is always null, since the protocol does not allow the application acknowledgment message to have an application acknowledgment.

At this point, the application acknowledgment portion of this message exchange is considered complete.

If the processing on the receiving system goes through multiple stages, chapter-defined messages may be used to relay status or informational changes to other systems (including the original initiating system). Such messages are not part of the acknowledgment scheme for the original message, but are considered to be independent messages triggered by events on the (original) responding system.

**Note:** The original acknowledgment protocol is equivalent to the enhanced acknowledgment protocol with *MSH-15-accept acknowledgment type* = NE and *MSH-16-application acknowledgment type* = AL, and with the application acknowledgment message defined so that it never requires an accept acknowledgment (*MSH-15-accept acknowledgment type* = NE).

# 2.13.2 Application (level 7) processing rules, deferred processing two phase reply (original acknowledgment mode only)

(This section remains in the specification only for reasons of providing backward compatibility: it is to be used only with the original acknowledgment protocol. For the original acknowledgment protocol, it creates a generic form of an asynchronous application level acknowledgment, the MCF message.)

The application processing rules for deferred processing are described here. In this mode the responding system sends an acknowledgment to the initiating system that means the message has been placed in some type of secure environment (e.g., disk storage), and the receiving system commits to processing it within a reasonable amount of time, if a) the message contains the necessary information, and b) nothing causes the message's request for action to be canceled before the responding system processes the request.

**Note:** Neither of these two conditions is completely checked at the time of the first acknowledgment. They are both checked at the time of processing.

The receipt of the first delayed acknowledgment by the initiating system means that the responding system has taken responsibility for the subsequent processing of the message. This also implies that the initiating system no longer needs to keep the particular message in its current form to send out later. For example, if

the sending system were maintaining a queue of outgoing messages, the particular message could be deleted from the output queue at this point.

The receipt of the second delayed acknowledgment message informs the initiating application of either: a) the application's successful processing of the initial message, or b) an error that prevented its processing. If the receiving application needs to return detailed change of status information, an application-specific message will be used. An example of the latter is the General Order message (ORM) described in Chapter 4.

The general delayed acknowledgment protocol is implemented on a site-specific and application-specific basis as needed. At a particular site, for a given transaction type the choices are:

- a) do not allow deferred acknowledgments
- b) all messages will have a deferred acknowledgment
- c) only exceptional cases (errors) will receive the deferred acknowledgment

In overview the processing for options b) and c) proceeds as follows:

Initiator receives message from sending application and sends it to the responding system.

The responding system receives the message from the initiating system and

- a) partially validates it syntactically and against the detailed rules described in Section 2.13.1,
   "Original and enhanced processing rules." This validation need not be complete but should be sufficient to determine the application that will ultimately respond to the message. If this validation fails, a reject message is constructed by the protocol software and returned to the initiator.
- b) (if the message passes this validation) stores it and constructs a response message that simply acknowledges receipt. *MSA-5-delayed acknowledgment type* then has a value of **D**.
- c) subsequently passes the message to the application, which:
  - 1) creates a response message, or
  - 2) creates an error message, or
  - 3) creates a reject message
- d) The protocol software sends the response, error, or reject message to the initiating system as an unsolicited update with no value present in *MSA-5-delayed acknowledgment type*.

The protocol software of the initiating system responds to the response, error, or reject message with simple acknowledgment and passes it to the initiating application.

The details follow.

#### 2.13.2.1 Initiation

The rules for creating the initial message are exactly as defined in Section 2.13.1, "Original and enhanced processing rules," for the original acknowledgment rules.

## 2.13.2.2 Response

The processing in the responding system follows this pattern:

Health Level Seven, Version 2.4 © 2000. All rights reserved.

- a) the protocol software accepts the message and validates it against at least the following criteria:
  - 1) the value in *MSH-9-message type* is one that is acceptable to the receiver
  - 2) the value in *MSH-12-version ID* is acceptable to the receiver
  - 3) the value in *MSH-11-processing ID* is appropriate for the application process handling the message

If any of these edits fail, the protocol software rejects the message. That is, it creates an ACK message with **AR** in *MSA-1-acknowledgment code*.

b) If the message passes the edits, the protocol software stores it and generates a response message of type ACK with a value of **AA** in *MSA-1-acknowledgment code* and **D** in *MSA-5-delayed acknowledgment type*.

c) Subsequently the protocol software passes the message to the application, which performs one of these functions:

1) processes the message successfully, generating the functional response message (message type MCF) with a value of **AA** in *MSA-1-acknowledgment code*.

- OR -

- 2) creates an error response, providing error information in functional segments to be included in the response message, which has a value of **AE** in *MSA-1-acknowledgment code*.
- OR -
- 3) fails to process (rejects) the message for reasons unrelated to its content or format (system down, internal error, etc.) For most such problems it is likely that the responding system will be able to accept the same message at a later time. The implementors must decide on an application-specific basis whether the message should be automatically sent again. The MSA segment of the response message contains a value of AR in *MSA-1-acknowledgment code*.

d) the application passes the message to the protocol software, which constructs a message of type MCF with  $\mathbf{F}$  in *MSA-5-delayed acknowledgment type*.

e) the protocol software passes the message to the initiating system as an unsolicited update.

f) the protocol software in the initiating system passes the response message to the initiating application and generates a simple ACK message. No value is present in *MSA-5-delayed acknowledgment type*.

All other values are put in the MSA segment as described in Section 2.13.1, "Original and enhanced processing rules."

# 2.14 ACKNOWLEDGMENT MESSAGES

Acknowledgment messages may be defined on an application basis. However the simple general acknowledgment message (ACK) may be used where the application does not define a special message (application level acknowl-edgment) and in other cases as described in Section 2.13.1, "Original and enhanced processing rules." *The MCF message is included only for backward compatibility with HL7 Version 2.1 (see Section 2.12.2, "*Application (level 7) processing rules, deferred processing two phase reply (original acknowledgment mode only)").

## 2.14.1 ACK - general acknowledgment

The simple general acknowledgment (ACK) can be used where the application does not define a special application level acknowledgment message or where there has been an error that precludes application

Page 2-96

processing. It is also used for accept level acknowledgments. The details are described in Section 2.13.1, "Original and enhanced processing rules."

| ACK^vai        | ries^ACK          | General Acknowledgment                                                                                                                                                                      | Chapter |
|----------------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|
| MSH            |                   | Message Header                                                                                                                                                                              | 2       |
| MSA            |                   | Message Acknowledgment                                                                                                                                                                      | 2       |
| [ <u>ERR</u> ] |                   | Error                                                                                                                                                                                       | 2       |
| Note:          | MSH-9-2-Trigger e | knowledgment (ACK) message, the value of <i>MSH-9-2-Trigger event</i> is equivent in the query message being acknowledged. The value of <i>MSH-9-3-I</i> nowledgment message is always ACK. |         |

## 2.14.2 MCF - delayed acknowledgment

*This message remains in the specification only for reasons of backward compatibility with HL7 Version* 2.1. It is used as part of the protocol which creates a generic form of an asynchronous application level acknowledgment, the MCF message. See Section 2.13.2.2, "Response."

The first MCF message, sent after the initial receipt has the following structure.

| MCF^varies^ACK                                                                 | Delayed Acknowledgment | Chapter |
|--------------------------------------------------------------------------------|------------------------|---------|
| MSH                                                                            | Message Header         | 2       |
| MSA                                                                            | Message Acknowledgment | 2       |
| [ <u>ERR</u> ]                                                                 | Error                  | 2       |
| The second MCF message, sent after application processing, has this structure: |                        |         |

| MCF^varies^ACK | Delayed Acknowledgment | Chapter |
|----------------|------------------------|---------|
| MSH            | Message Header         | 2       |
| MSA            | Message Acknowledgment | 2       |
| [ ERR ]        | Error                  | 2       |

# 2.15 SPECIAL HL7 PROTOCOLS

This section contains several extensions to the basic HL7 message protocol. These extensions represent implementation choices, and are to be used on a site-specific and application-specific basis as needed.

## 2.15.1 Sequence number protocol

For certain types of data transactions between systems the issue of keeping databases synchronized is critical. An example is an ancillary system such as lab, which needs to know the locations of all inpatients to route stat results correctly. If the lab receives an ADT transaction out of sequence, the census/location information may be incorrect. Although it is true that a simple one-to-one acknowledgment scheme can prevent out-of-sequence transactions between any two systems, only the use of sequence numbers can prevent duplicate transactions.

a) initial conditions:

- the system receiving the data stream is expected to store the sequence number of the most recently accepted transaction in a secure fashion before acknowledging that transaction. This stored sequence number allows comparison with the next transaction's sequence number, and the implementation of fault-tolerant restart capabilities.
- 2) the initiating system keeps a queue of outgoing transactions indexed by the sequence number. The length of this queue must be negotiated as part of the design process for a given link. The minimum length for this queue is one.

Health Level Seven, Version 2.4 © 2000. All rights reserved.

- 3) the sequence number is a positive (non-zero) integer; and it is incremented by one (by the initiating system) for each successive transaction.
- b) starting the link:
  - 1) the value of 0 (zero) for a sequence number is reserved: it is allowed only when the initiating system (re-)starts the link.
  - 2) if the receiving system gets a transaction with a 0 (zero) in the sequence number field, it should respond with a general acknowledgment message whose MSA contains a sequence number one greater than the sequence number of the last transaction it accepted in the Expected Sequence Number field. If this value does not exist (as on the first startup of a given link), the MSA should contain a sequence number of -1, meaning that the receiving system will use the positive, non-zero sequence number of the first transaction it accepts as its initial sequence number (see resynching the link, item e below).
  - 3) the initiating system then sends the transaction indexed by the expected sequence number (if that expected transaction is still on its queue). Otherwise the link is frozen until an operator intervenes.
- c) normal operation of the link:

As it accepts each transaction, the receiving system securely stores the sequence number (which agrees with its expected sequence number), and then acknowledges the message by echoing the sequence number in *MSA-4-expected sequence number*.

d) error conditions (from point of view of initiating system). These are generated by the receiving system, by its comparison of the sequence number sent out (with the MSH in *MSH-13-sequence number*) with the expected sequence number (*MSA-4-expected sequence number* received with the MSA).

- 1) **expected sequence number is one greater than current value**. The previous acknowledgment was lost. That transaction was sent again. Correct by sending next transaction.
- 2) **expected sequence number less than current value**. Initiating system can try starting again by issuing a transaction with a sequence number of zero; or freeze the link for operator intervention.
- 3) other errors: freeze the link for operator intervention

e) forcing resynchronization of sequence numbers across the link. The value of -1 for a sequence number is reserved: it is allowed only when the initiating system is resynching the link. Thus if the receiving system gets a value of -1 in the sequence number field, it should return a general acknowledgment message with a -1 in the expected sequence number field. The receiving system then resets its sequence number, using the non-zero positive sequence number of the next transaction it accepts.

f) notes

When the initiating system sends a message with a sequence number of 0 or -1 (see b or e above), the segments beyond the MSH need not be present in the message, or, if present, all fields can be null. In terms of the responding system, for these two cases, only a General acknowledgment message is needed.

## 2.15.2 Continuation messages and segments

Sometimes, implementation limitations require that large messages or segments be broken into manageable chunks. We use the term "fragmentation" to describe how a logical message is broken into one or more separate HL7 messages. HL7 consciously identifies two situations where this may happen.

• First, a single segment may be too large. HL7 uses the "ADD" segment to handle breaking a single segment into several smaller segments.

• Second, a single HL7 message may be too large. HL7 uses the DSC segment and the continuation protocol to handle message fragmentation.

Note: HL7 does not define what "too large" means. Acceptable values are subject to site negotiations.

See chapter 5 for a discussion of the continuation pointer segment and the continuation pointer field, and their use in the continuation of responses to queries and in the continuation of unsolicited update messages.

## 2.15.2.1 Segment fragmentation/continuation using the ADD segment

Beginning with version 2.4, the ADD segment can be used <u>within</u> a message to break a long segment into shorter segments within a single HL7 message.

**Note:** Unless some explicit agreement exists between systems, a receiving application should not infer semantic meaning from the placement of the ADD segment.

To break a large segment,

- a) the segment being continued (call it ANY for this example) is ended at an arbitrary character position and terminated with the standard segment terminator (carriage return).
- b) the following segment is the ADD segment. All characters after the ADD and field separator ("|") are logically part of the preceding segment. All succeeding consecutive ADD segments contribute characters to the ANY segment until a non ADD segment is found.
- c) An ADD segment with no field separator takes on special meaning. See Section 2.14.2.3, "Segment fragmentation across messages."

For example, segment "C" can be fragmented within an HL7 message as follows

A | 1 B | 2 C | 34 ADD | 5 | 678 | ADD | 90 D | 1

This is logically the same as

A | 1 B | 2 C | 345 | 678 | 90 D | 1

Note that the "|" at the end of the first ADD segment is part of the value, while the first "|" of each ADD is not.

2.15.2.2 Segment fragmentation/continuation using the DSC segment

When a message itself must be fragmented and sent as several HL7 messages, the DSC segment is used.

- a) First, the logical message is broken after an arbitrary segment.
- b) Next, a DSC segment is sent. The *DSC-1-Continuation pointer* field will contain a unique value which is used to match a subsequent message with this specific value.
- c) The DSC terminates the first fragment of the logical message.

- d) A subsequent message will contain in MSH-14-Continuation pointer, a value which matches the value from DSC-1. (The presence of a value in MSH-14 indicates that the message is a fragment of an earlier message.). Each subsequent message will have its own unique value for MSH-10-Message control ID. Coordination between DSC-1-Continuation pointer and the subsequent message's MSH-14-Continuation pointer is used to link the fragments in their proper order.
- e) The logical message is the concatenation of the contents of the first message (which while having no value in MSH-14, did end with DSC, and hence was actually a message fragment), plus all subsequent fragments (as identified by values in MSH-14).
- f) If enhanced mode acknowledgments are used to request an accept ACK, then the receiver will acknowledge each fragment with an ACK message. Since each fragment has its own Message Control ID, each fragment level accept ACK will use the Message Control ID from the fragment it is acknowledging.
- g) If enhanced mode acknowledgments are used to request an application level ACK, then the receiver will send an acknowledgment after receiving the final fragment.

Note: The application level ACK should refer to the message by the Message Control ID of the first fragment.

**Note:** The receiver can tell that a given incoming message is a fragment by the presence of the trailing DSC. Subsequent HL7 messages are identified as fragments by the presence of an MSH-14 value. The presence of a DSC in a fragment indicates that more fragments are to follow.

It is a protocol error to end a message with DSC, and then never send a fragment.

For example, a single logical message may be fragmented into three HL7 messages.

```
---- Sender HL7 message (incomplete, fragment1)---
MSH|||||||||1001||2.4|123||..
A|...
B|...
B|...
DSC|W4xy
---- Sender HL7 message (fragment 2)---
MSH|||||||||2106||2.4|124|W4xy|
C|...
D|...
DSC|V292
----- another HL7 message(fragment 3, final)----
MSH||||||||2401||2.4|125|V292
E|...
```

Such a sequence is logically the same as the single message

MSH | .... |2. 4 | 123 | | . . A | ... B | ... C | ... D | ... E | ... See example in section 2.18.4 for a more elaborate example.

#### 2.15.2.3 Segment fragmentation across messages

If the last segment of a fragment itself needs to be broken, then the following idiomatic use of ADD shall apply.

- a) the segment being continued (call it ANY for this example) is ended at an arbitrary character position and terminated with the standard segment terminator (carriage return).
- b) the following segment is the ADD segment. It will contain no characters other than "ADD". (The lack of characters signals the receiver that ANY will be continued.)
- c) The second following segment will be the DSC, used as described above in Section 2.15.2.2, "Segment fragmentation/continuation using the DSC segment ".
- d) The first segment of the following fragment will be an ADD segment. The characters of this ADD segment are logically part of the ANY segment of the previous fragment.

For example

```
MSH|...|2.4|
A|12
ADD
DSC|JR97
----- (fragment 2)
MSH|...|2.4|JR97
ADD|345
```

is logically the same as

MSH|...|2.4 A|12345

e) transaction flow for a continued unsolicited message with a continued segment. first unsolicited message and acknowledgment:

|        | MSH                       |                                                                    |
|--------|---------------------------|--------------------------------------------------------------------|
|        | URD                       |                                                                    |
|        | [ URS ]                   |                                                                    |
|        | {DSP}                     | (last DSP is incomplete)                                           |
|        | ADD                       | (contains no fields)                                               |
|        | DSC                       | (Continuation segment)                                             |
|        | MSH                       | (General acknowledgment)                                           |
|        | MSA                       |                                                                    |
|        | [ ERR ]                   |                                                                    |
| f) sec | ond unsolicited message a | nd acknowledgment:                                                 |
| ,      | C                         | č                                                                  |
|        | MOTI                      | (contains continuation pointer from DSC segment of prior           |
|        | MSH                       | (concarns conclinuation poincer from DSC segment of prior          |
|        | MSH                       | message)                                                           |
|        | ADD                       |                                                                    |
|        |                           | message)                                                           |
|        |                           | message)<br>(contains remainder of data from continued DSP segment |
|        | ADD                       | message)<br>(contains remainder of data from continued DSP segment |
| Note:  | ADD<br>{DSP}              | message)<br>(contains remainder of data from continued DSP segment |

MSA [ERR]

## 2.15.3 HL7 batch protocol

There are instances when it is convenient to transfer a batch of HL7 messages. Common examples would be a batch of financial posting detail transactions (DFT's) sent from an ancillary to a financial system. Such a batch could be sent online using a common file transfer protocol, or offline via tape or diskette.

## 2.15.3.1 HL7 batch file structure

The structure of an HL7 batch file is given by the following (using the HL7 abstract message syntax)

| [FHS]<br>{ [BHS]<br>{ [MSH | (file header segment)<br>(batch header segment)<br>(zero or more HL7 messages) |
|----------------------------|--------------------------------------------------------------------------------|
|                            |                                                                                |
|                            |                                                                                |
| [BTS]                      | (batch trailer segment)                                                        |
| [FTS]                      | (file trailer segment)                                                         |

Notes:

The sequence numbering protocol has a natural application in batch transfers. See the discussion of batch acknowledgments that follows.

Although a batch will usually consist of a single type of message, there is nothing in the definition that restricts a batch to only one message type.

The HL7 file and batch header and trailer segments are defined in exactly the same manner as the HL7 message segments. Hence the HL7 message construction rules of Section 2.11, "Message construction rules," can be used to encode and decode HL7 batch files.

There are only two cases in which an HL7 batch file may contain zero HL7 messages:

- a) a batch containing zero HL7 messages may be sent to meet a requirement for periodic submission of batches when there are no messages to send.
- b) a batch containing zero negative acknowledgment messages may be sent to indicate that all the HL7 messages contained in the batch being acknowledged are implicitly acknowledged. See Section 2.15.3.3, "Acknowledging batches."

## 2.15.3.2 Related segments and data usage

The following segments defined in Section 2.16, "MESSAGE CONTROL SEGMENTS" relate to the HL7 Batch Protocol:

- BHS Batch Header
- BTS Batch Trailer
- FHS File Header
- FTS File Trailer

The BTS segment contains a field, *BTS-3-batch totals*, which may have one or more totals drawn from fields within the individual messages. The method for computing such totals will be determined on a site or application basis unless explicitly stated in a functional chapter.

## 2.15.3.3 Acknowledging batches

In general, the utility of sending batches of data is that the data is accepted all at once, with errors processed on an exception basis. However, it is a permissible application of HL7 to acknowledge all messages. Several options for acknowledgment are given and will be chosen on an application basis. In these cases, the sequence numbering protocol can be useful to the applications processing the batch.

The options are:

- a) all messages are acknowledged in the response batch.
- b) the receiving system prints some form of batch control report, which is then dealt with manually by personnel at the sending system. No acknowledgments are performed by the protocol software.
- c) an automated acknowledgment batch is created containing acknowledgment messages only for those messages containing errors. In this mode an empty acknowledgment batch may be created (i.e., an HL7 batch file without any HL7 acknowledgment messages).

In each case where there is a response batch, its format is a batch of individual messages. Each individual message is in the format defined for an online response in the chapters. Consider, for example, a batch that might be constructed to respond to a batch of Detailed Financial Transactions (Chapter 6). The messages in the response batch would consist entirely of ACK messages, since ACK is the response shown in Chapter 6.

When batches are retransmitted after the correction of errors, *BHS-12-reference batch control ID* should contain the batch control ID of the original batch.

## 2.15.3.4 Batch message as a query response

The HL7 query also can be used to query for a batch in the following manner:

- a) use the value BB or BL of *QRD-5-deferred response type* to specify a batch response. The query will be acknowledged with a general acknowledgment as in the Deferred Access example above (see chapter 5)
- b) in addition, insert into the batch file the QRD and QRF segments as follows:

| [FHS]<br>{ [BHS]<br>[QRD] | (file header segment)<br>(batch header segment)<br>(the QRD and QRF define the |
|---------------------------|--------------------------------------------------------------------------------|
| [QRF]<br>{ MSH            | query that this batch is a response to) (one or more HL7 messages)             |
|                           |                                                                                |
|                           |                                                                                |
| ·····<br>}                |                                                                                |
| [BTS]<br>}                | (batch trailer segment)                                                        |
| [FTS]                     | (file trailer segment)                                                         |
|                           |                                                                                |

c) the acknowledgment of a batch is described in this chapter (see Section 2.15.3.3, "Acknowledging batches").

## 2.15.4 Modes for updating via repeating segments

When groups of repeating segments appear within a message it is not obvious from the basic HL7 abstract message syntax how best to apply the new group of repeating segments on the receiving system. HL7 suggests two methods: the "snapshot" mode and the "action code/unique identifier" mode.

Health Level Seven, Version 2.4 © 2000. All rights reserved.

## Background:

The segments which repeat in HL7 messages Patient Administration (ADT)/Financial Information messages (AL1, DG1, PR1, GT1, IN1, IN2, IN3, NK1, NTE) present a problem if the requirement is to update only part of the information previously sent. Prior to Version 2.3 of the Standard, all such repeating segments had to be sent again in the update, because there was no way to indicate which ones changed and which ones did not. For example, if two DG1 segments were sent originally (containing a primary and secondary diagnosis), and then if a tertiary diagnoses needed to be sent, the sending system had to send all diagnoses which were currently valid, that is, three DG1 segments (containing primary, secondary and tertiary diagnosis). This way of doing things is referred to as the "snapshot" mode. In this mode, everything (all repeating segments) must be sent with every subsequent message in the series of messages.

In the Order Entry, Observation Reporting, and Master Files chapters, action codes (e.g., order control codes and result status codes) and unique identifiers (e.g., placer and filler numbers) are currently specified as part of the ORC, OBR, OBX and MFE segments. So, except for the NTE segments, this problem exists mainly for the Patient Administration and Financial Management chapter segments.

For systems implementing Version 2.3 or higher, if a particular repeating segment can be updated by either of these two modes, the parties concerned will determine by agreement on a site-specific basis whether an interface will use the "snapshot" mode or the "action code/unique identifier" mode.

## 2.15.4.1 Snapshot mode update definition

In the "snapshot" mode, the group of repeating segments from the incoming message replaces the prior group of repeating segments on the receiving system. This is equivalent to a deletion of the prior group followed by the addition of the new group. The snapshot mode is the usual mode in Version 2.2 and 2.1 implementations of HL7, but it is also available for Version 2.3 and future versions. To specify "delete all of the segments in this repeating group" in the snapshot mode, send a single segment with "delete data" indicated for all fields.

For example, if the following DG1 segment is in an ADT update message (for an inpatient stay):

DG1 | " " | " " | " " | " " | " " | " " | " " | " " | " " | " " | " " | " " | " " | " " | " " | " " | " " | " <cr>

and the snapshot mode is being used, this indicates that all previously-transmitted diagnoses for this inpatient stay should be deleted.

## 2.15.4.2 Action code/unique identifier mode update definition

In the "action code/unique identifier" mode, each member of a repeating group of segments must have a unique identifier (equivalent to the filler number in observational reports messages). The choice of delete/update/insert is determined by the action code (equivalent to the result status in observational reports messages). Refer to <u>HL7 Table 0206 - Segment action code</u> for valid values.

| Value | Description |
|-------|-------------|
| A     | Add/Insert  |
| D     | Delete      |
| U     | Update      |

HL7 Table 0206 - Segment action code

The *unique identifier* is defined in a general manner as follows: it uniquely identifies one of multiple repetitions of the primary entity defined by the repeating segment in a way that does not change over time. It is not dependent on any particular message identifier level (MSH) fields; it functions across messages, not just within a message. The *unique identifier* will be chosen on a segment-specific basis, depending on the primary entity referenced by the segment. For some cases, such as a diagnosis code, it may be a CE data

type. For others, such as a person identifier, it may be a CX data type. For others it may be an EI (entity identifier) data type.

**Note:** This mode is available for use only for new segments for Version 2.3 and for new segments in future versions

# 2.16 MESSAGE CONTROL SEGMENTS

The following segments are necessary to support the functionality described in this chapter.

**Note:** The HL7 message construction rules define the standard HL7 encoding rules, creating variable length delimited messages from the segments defined below. Although only one set of encoding rules is defined as a standard in HL7 Version 2.3, other encoding rules are possible (but since they are non-standard, they may only used by a site-specific agreement).

The segments in this section are listed in alphabetical order. The following chart shows a summary of the segments listed by category.

| Segment Category | Segment Name                                    | HL7 Section Reference |
|------------------|-------------------------------------------------|-----------------------|
| Control          |                                                 |                       |
|                  | ADD                                             | 2.16.1                |
|                  | BHS                                             | 2.16.2                |
|                  | BTS                                             | 2.16.3                |
|                  | DSC                                             | 2.16.4                |
|                  | ERR                                             | 2.16.5                |
|                  | FHS                                             | 2.16.6                |
|                  | FTS                                             | 2.16.7                |
|                  | MSA                                             | 2.16.8                |
|                  | MSH                                             | 2.16.9                |
| General Purpose  |                                                 |                       |
|                  | NTE                                             | 2.16.10               |
| Query            |                                                 |                       |
|                  | All query segments have been moved to chapter 5 |                       |

#### Figure 2-8. HL7 message segments

## 2.16.1 ADD - addendum segment

The ADD segment is used to define the continuation of the prior segment in a continuation message. See Section2.15.2, "Continuation messages and segments," for details.

| SEQ | LEN       | DT | OPT | RP/# | TBL# | ITEM# | ELEMENT NAME                  |
|-----|-----------|----|-----|------|------|-------|-------------------------------|
| 1-n | 655<br>36 | ST | 0   |      |      | 00066 | Addendum Continuation Pointer |

2.16.1.0 ADD field definition

2.16.1.1 ADD-1 Addendum continuation pointer (ST) 00066

Definition: This field is used to define the continuation of the prior segment in a continuation message. See section 2.15.2, "Continuation messages and segments" for details. When the ADD is sent after the segment being continued, it contains no fields. It is only a marker that the previous segment is being continued in a subsequent message. Thus fields 1-N are not present. The sequence designation, 1-N, means the remainder of the fields in the segment being continued. These remainder of the segment being continued is sent with a continuation message.

## 2.16.2 BHS - batch header segment

The BHS segment defines the start of a batch.

| SEQ | LEN | DT | OPT | RP/# | TBL# | ITEM # | ELEMENT NAME                |  |  |  |
|-----|-----|----|-----|------|------|--------|-----------------------------|--|--|--|
| 1   | 1   | ST | R   |      |      | 00081  | Batch Field Separator       |  |  |  |
| 2   | 3   | ST | R   |      |      | 00082  | Batch Encoding Characters   |  |  |  |
| 3   | 15  | ST | 0   |      |      | 00083  | Batch Sending Application   |  |  |  |
| 4   | 20  | ST | 0   |      |      | 00084  | Batch Sending Facility      |  |  |  |
| 5   | 15  | ST | 0   |      |      | 00085  | Batch Receiving Application |  |  |  |
| 6   | 20  | ST | 0   |      |      | 00086  | Batch Receiving Facility    |  |  |  |
| 7   | 26  | TS | 0   |      |      | 00087  | Batch Creation Date/Time    |  |  |  |
| 8   | 40  | ST | 0   |      |      | 00088  | Batch Security              |  |  |  |
| 9   | 20  | ST | 0   |      |      | 00089  | Batch Name/ID/Type          |  |  |  |
| 10  | 80  | ST | 0   |      |      | 00090  | Batch Comment               |  |  |  |
| 11  | 20  | ST | 0   |      |      | 00091  | Batch Control ID            |  |  |  |
| 12  | 20  | ST | 0   |      |      | 00092  | Reference Batch Control ID  |  |  |  |

HL7 Attribute Table - BHS - Batch Header

## 2.16.2.0 BHS field definitions

## 2.16.2.1 BHS-1 Batch field separator (ST) 00081

Definition: This field contains the separator between the segment ID and the first real field, *BHS-2-batch encoding characters*. As such it serves as the separator and defines the character to be used as a separator for the rest of the message. Recommended value is |,(ASCII 124).

## 2.16.2.2 BHS-2 Batch encoding characters (ST) 00082

Definition: This field contains the four characters in the following order: the component separator, repetition separator, escape characters, and subcomponent separator. Recommended values are ^~\& (ASCII 94, 126, 92, and 38, respectively). See Section 2.8, "MESSAGE DELIMITERS."

## 2.16.2.3 BHS-3 Batch sending application (ST) 00083

Definition: This field uniquely identifies the sending application among all other applications within the network enterprise. The network enterprise consists of all those applications that participate in the exchange of HL7 messages within the enterprise. Entirely site-defined.

## 2.16.2.4 BHS-4 Batch sending facility (ST) 00084

Definition: This field contains the address of one of several occurrences of the same application within the sending system. Absent other considerations, the Medicare Provider ID might be used with an appropriate sub-identifier in the second component. Entirely user-defined.

## 2.16.2.5 BHS-5 Batch receiving application (ST) 00085

Definition: This field uniquely identifies the receiving applications among all other applications within the network enterprise. The network enterprise consists of all those applications that participate in the exchange of HL7 messages within the enterprise. Entirely site-defined.

## 2.16.2.6 BHS-6 Batch receiving facility (ST) 00086

Definition: This field identifies the receiving application among multiple identical instances of the application running on behalf of different organizations. See comments *BHS-4-batch sending facility*. Entirely site-defined.

## 2.16.2.7 BHS-7 Batch creation date/time (TS) 00087

Definition: This field contains the date/time that the sending system created the message. If the time zone is specified, it will be used throughout the message as the default time zone.

## 2.16.2.8 BHS-8 Batch security (ST) 00088

Definition: In some applications of HL7, this field is used to implement security features. Its use is not yet further specified.

## 2.16.2.9 BHS-9 Batch name/ID/type (ST) 00089

Definition: This field can be used by the application processing the batch. It can have extra components if needed.

2.16.2.10 BHS-10 Batch comment (ST) 00090

Definition: This field is a comment field that is not further defined in the HL7 protocol.

2.16.2.11 BHS-11 Batch control ID (ST) 00091

Definition: This field is used to uniquely identify a particular batch. It can be echoed back in *BHS-12-reference batch control ID* if an answering batch is needed.

2.16.2.12 BHS-12 Reference batch control ID (ST) 00092

Definition: This field contains the value of *BHS-11-batch control ID* when this batch was originally transmitted. Not present if this batch is being sent for the first time. See definition for *BHS-11-batch control ID*.

## 2.16.3 BTS - batch trailer segment

The BTS segment defines the end of a batch.

| SEQ | LEN | DT | OPT | RP/# | TBL# | ITEM # | ELEMENT NAME        |  |  |
|-----|-----|----|-----|------|------|--------|---------------------|--|--|
| 1   | 10  | ST | 0   |      |      | 00093  | Batch Message Count |  |  |
| 2   | 80  | ST | 0   |      |      | 00090  | Batch Comment       |  |  |

Health Level Seven, Version 2.4 © 2000. All rights reserved.

| SEQ | LEN | DT | OPT | RP/# | TBL# | ITEM # | ELEMENT NAME |
|-----|-----|----|-----|------|------|--------|--------------|
| 3   | 100 | NM | 0   | Y    |      | 00095  | Batch Totals |

#### 2.16.3.0 BTS field definitions

2.16.3.1 BTS-1 Batch message count (ST) 00093

Definition: This field contains the count of the individual messages contained within the batch.

## 2.16.3.2 BTS-2 Batch comment (ST) 00090

Definition: This field is a comment field that is not further defined in the HL7 protocol.

## 2.16.3.3 BTS-3 Batch totals (NM) 00095

Definition: We encourage new users of this field to use the HL7 Version 2.3 data type of NM and to define it as "repeating." This field contains the batch total. If more than a single batch total exists, this field may be repeated.

This field may be defined as a CM data type for backward compatibility with HL7 Versions 2.2 and 2.1 with each total being carried as a separate component. Each component in this case is an NM data type.

## 2.16.4 DSC - continuation pointer segment

The DSC segment is used in the continuation protocol.

|     |     | 111 | 27 711110 | ute Tubi | e Dbe | Continue | tuon i onitei        |
|-----|-----|-----|-----------|----------|-------|----------|----------------------|
| SEQ | LEN | DT  | OPT       | RP/#     | TBL#  | ITEM #   | ELEMENT NAME         |
| 1   | 180 | ST  | 0         |          |       | 00014    | Continuation Pointer |
| 2   | 1   | ID  | 0         |          | 0398  | 01354    | Continuation Style   |

HL7 Attribute Table - DSC - Continuation Pointer

2.16.4.0 DSC field definitions

2.16.4.1 DSC-1 Continuation pointer (ST) 00014

Definition: This field contains the continuation pointer. In an initial query, this field is not present. If the responder returns a value of null or not present, then there is no more data to fulfill any future continuation requests. For use with continuations of unsolicited messages, see chapter 5 and section 2.15.2, "Continuation messages and segments." Note that continuation protocols work with both display- and record-oriented messages.

## 2.16.4.2 DSC-2 Continuation style (ID) 01354

Definition: Indicates whether this is a fragmented message (see Section 2.15.2, "Continuation messages and segments"), or if it is part of an interactive continuation message (see Section 5.6.3, "Interactive continuation of response messages").

Refer to HL7 Table 0398 - Continuation style code for valid values.

| Value | Description              |
|-------|--------------------------|
| F     | Fragmentation            |
| I     | Interactive Continuation |

HL7 Table 0398 - Continuation style code

## 2.16.5 ERR - error segment

The ERR segment is used to add error comments to acknowledgment messages.

|     | TEL / Autobuc Fable - EKK -EITO |    |     |      |      |        |                         |  |  |  |
|-----|---------------------------------|----|-----|------|------|--------|-------------------------|--|--|--|
| SEQ | LEN                             | DT | OPT | RP/# | TBL# | ITEM # | ELEMENT NAME            |  |  |  |
| 1   | 80                              | СМ | R   | Y    |      | 00024  | Error Code and Location |  |  |  |

2.16.5.0 ERR field definition

#### 2.16.5.1 ERR-1 Error code and location (CM) 00024

Definition: This field identifies an erroneous segment in another message. The second component is an index if there is more than one segment of type <segment ID>. For systems that do not use the HL7 Encoding Rules, the data item number may be used for the third component. The fourth component (which references <u>HL7 Table 0357 - Message error condition codes</u>, (as a CE data type)) is restricted from having any subcomponents as the subcomponent separator is now the CE's component separator.

**Note:** See section 2.16.8.6, MSA-6-error condition, for a listing of this table.

## 2.16.6 FHS - file header segment

The FHS segment is used to head a file (group of batches) as defined in Section 2.15.3, "HL7 batch protocol."

| SEQ | LEN | DT | OPT | RP/# | TBL# | ITEM # | ELEMENT NAME               |
|-----|-----|----|-----|------|------|--------|----------------------------|
| 1   | 1   | ST | R   |      |      | 00067  | File Field Separator       |
| 2   | 4   | ST | R   |      |      | 00068  | File Encoding Characters   |
| 3   | 15  | ST | 0   |      |      | 00069  | File Sending Application   |
| 4   | 20  | ST | 0   |      |      | 00070  | File Sending Facility      |
| 5   | 15  | ST | 0   |      |      | 00071  | File Receiving Application |
| 6   | 20  | ST | 0   |      |      | 00072  | File Receiving Facility    |
| 7   | 26  | TS | 0   |      |      | 00073  | File Creation Date/Time    |
| 8   | 40  | ST | 0   |      |      | 00074  | File Security              |
| 9   | 20  | ST | 0   |      |      | 00075  | File Name/ID               |
| 10  | 80  | ST | 0   |      |      | 00076  | File Header Comment        |
| 11  | 20  | ST | 0   |      |      | 00077  | File Control ID            |
| 12  | 20  | ST | 0   |      |      | 00078  | Reference File Control ID  |

HL7 Attribute Table - FHS - File Header

2.16.6.0 FHS field definitions

2.16.6.1 FHS-1 File field separator (ST) 00067

Definition: This field has the same definition as the corresponding field in the MSH segment.

2.16.6.2 FHS-2 File encoding characters (ST) 00068

Definition: This field has the same definition as the corresponding field in the MSH segment.

Health Level Seven, Version 2.4 © 2000. All rights reserved.

- 2.16.6.3 FHS-3 File sending application (ST) 00069Definition: This field has the same definition as the corresponding field in the MSH segment.
- 2.16.6.4 FHS-4 File sending facility (ST) 00070

Definition: This field has the same definition as the corresponding field in the MSH segment.

2.16.6.5 FHS-5 File receiving application (ST) 00071

Definition: This field has the same definition as the corresponding field in the MSH segment.

2.16.6.6 FHS-6 File receiving facility (ST) 00072

Definition: This field has the same definition as the corresponding field in the MSH segment.

2.16.6.7 FHS-7 File creation date/time (TS) 00073

Definition: This field has the same definition as the corresponding field in the MSH segment.

2.16.6.8 FHS-8 File security (ST) 00074

Definition: This field has the same definition as the corresponding field in the MSH segment.

2.16.6.9 FHS-9 File name/ID (ST) 00075

Definition: This field can be used by the application processing file. Its use is not further specified.

2.16.6.10 FHS-10 File header comment (ST) 00076

Definition: This field contains the free text field, the use of which is not further specified.

2.16.6.11 FHS-11 File control ID (ST) 00077

Definition: This field is used to identify a particular file uniquely. It can be echoed back in *FHS-12-reference file control ID*.

2.16.6.12 FHS-12 Reference file control ID (ST) 00078

Definition: This field contains the value of *FHS-11-file control ID* when this file was originally transmitted. Not present if this file is being transmitted for the first time.

#### 2.16.7 FTS - file trailer segment

The FTS segment defines the end of a file.

HL7 Attribute Table - FTS - File Trailer

| SEQ | LEN | DT | OPT | RP/# | TBL# | ITEM # | ELEMENT NAME         |
|-----|-----|----|-----|------|------|--------|----------------------|
| 1   | 10  | NM | 0   |      |      | 00079  | File Batch Count     |
| 2   | 80  | ST | 0   |      |      | 08000  | File Trailer Comment |

2.16.7.0 FTS field definitions

2.16.7.1 FTS-1 File batch count (NM) 00079

Definition: This field contains the number of batches contained in this file.

#### 2.16.7.2 FTS-2 File trailer comment (ST) 00080

Definition: The use of this free text field is not further specified.

## 2.16.8 MSA - message acknowledgment segment

The MSA segment contains information sent while acknowledging another message.

|     | The function function for the state for the state of the |    |     |      |             |                    |                             |  |

| 5   | 1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | ID | В   |      | <u>0102</u> | 00022              | Delayed Acknowledgment Type |  |
| 6   | 250                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | CE | 0   |      | <u>0357</u> | 00023              | Error Condition             |  |

HL7 Attribute Table - MSA - Message Acknowledgment

#### 2.16.8.0 MSA field definitions

2.16.8.1 MSA-1 Acknowledgment code (ID) 00018

Definition: This field contains an acknowledgment code, see message processing rules. Refer to <u>HL7 Table 0008 - Acknowledgment code</u> for valid values.

| HL7 Table 0008 - Acknowledgment code | HL7 Table 0008 - Ackn | nowledgment code |
|--------------------------------------|-----------------------|------------------|
|--------------------------------------|-----------------------|------------------|

| Value | Description                                                                           |
|-------|---------------------------------------------------------------------------------------|
| AA    | Original mode: Application Accept - Enhanced mode: Application acknowledgment: Accept |
| AE    | Original mode: Application Error - Enhanced mode: Application acknowledgment: Error   |
| AR    | Original mode: Application Reject - Enhanced mode: Application acknowledgment: Reject |
| CA    | Enhanced mode: Accept acknowledgment: Commit Accept                                   |
| CE    | Enhanced mode: Accept acknowledgment: Commit Error                                    |
| CR    | Enhanced mode: Accept acknowledgment: Commit Reject                                   |

#### 2.16.8.2 MSA-2 Message control ID (ST) 00010

Definition: This field contains the message control ID of the message sent by the sending system. It allows the sending system to associate this response with the message for which it is intended.

#### 2.16.8.3 MSA-3 Text message (ST) 00020

Definition: This optional field further describes an error condition. This text may be printed in error logs or presented to an end user.

Use of *MSA-3-text message* and *MSA-6-error condition* are deprecated in favor of *ERR-1-Error code and location*. The ERR segment allows for richer descriptions of the erroneous conditions.

#### 2.16.8.4 MSA-4 Expected sequence number (NM) 00021

Definition: This optional numeric field is used in the sequence number protocol.

#### 2.16.8.5 MSA-5 Delayed acknowledgment type (ID) 00022

Definition: *This field has been retained for backward compatibility*. This field is used only as described above, in Section 2.13.2, "Application (level 7) processing rules, deferred processing two phase reply (original acknowledgment mode only)." Otherwise this field is not used.

| HL7 Table 0102 - Delayed acknowledgment type | ; |
|----------------------------------------------|---|
|----------------------------------------------|---|

| Value | Description                                   |
|-------|-----------------------------------------------|
| D     | Message received, stored for later processing |
| F     | acknowledgment after processing               |

#### 2.16.8.6 MSA-6 Error condition (CE) 00023

```
\label{eq:components: (identifier (ST)> ^ <text (ST)> ^ <name of coding system (IS)> ^ <alternate identifier (ST)> ^ <alternate text (ST)> ^ <name of alternate coding system (IS)> </arcsected alte
```

Definition: This field allows the acknowledging system to use a user-defined error code to further specify AR or AE type acknowledgments. This field is a generalized replacement for *MSA-3-text message*.

Use of *MSA-3-text message* and *MSA-6-error condition* are deprecated in favor of *ERR-1-Error code and location*. The ERR segment allows for richer descriptions of the erroneous conditions.

The Message Error Condition codes are defined by HL7 Table 0357 - Message error condition codes.

| Error<br>Condition<br>Code | Error Condition Text      | Description/Comment                                                                                                                     |
|----------------------------|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Success                    |                           |                                                                                                                                         |
| 0                          | Message accepted          | Success. Optional, as the AA conveys success. Used for systems that must always return a status code.                                   |
| Errors                     |                           |                                                                                                                                         |
| 100                        | Segment sequence error    | The message segments were not in the proper order, or required segments are missing.                                                    |
| 101                        | Required field missing    | A required field is missing from a segment                                                                                              |
| 102                        | Data type error           | The field contained data of the wrong data type, e.g. an NM field contained "FOO".                                                      |
| 103                        | Table value not found     | A field of data type ID or IS was compared against the corresponding table, and no match was found.                                     |
| Rejection                  |                           |                                                                                                                                         |
| 200                        | Unsupported message type  | The Message Type is not supported.                                                                                                      |
| 201                        | Unsupported event code    | The Event Code is not supported.                                                                                                        |
| 202                        | Unsupported processing id | The Processing ID is not supported.                                                                                                     |
| 203                        | Unsupported version id    | The Version ID is not supported.                                                                                                        |
| 204                        | Unknown key identifier    | The ID of the patient, order, etc., was not found. Used for transactions other than additions, e.g. transfer of a non-existent patient. |
| 205                        | Duplicate key identifier  | The ID of the patient, order, etc., already exists. Used in response to addition transactions (Admit, New Order, etc.).                 |
| 206                        | Application record locked | The transaction could not be performed at the application storage level, e.g.                                                           |

| Error<br>Condition<br>Code | Error Condition Text       | Description/Comment                                                   |
|----------------------------|----------------------------|-----------------------------------------------------------------------|
|                            |                            | database locked.                                                      |
| 207                        | Application internal error | A catchall for internal errors not explicitly covered by other codes. |

## 2.16.9 MSH - message header segment

The MSH segment defines the intent, source, destination, and some specifics of the syntax of a message.

| SEQ | LEN | DT  | OPT | RP/# | TBL#          | ITEM # | ELEMENT NAME                            |
|-----|-----|-----|-----|------|---------------|--------|-----------------------------------------|
| 1   | 1   | ST  | R   |      |               | 00001  | Field Separator                         |
| 2   | 4   | ST  | R   |      |               | 00002  | Encoding Characters                     |
| 3   | 180 | HD  | 0   |      | <u>0361</u>   | 00003  | Sending Application                     |
| 4   | 180 | HD  | 0   |      | <u>0362</u>   | 00004  | Sending Facility                        |
| 5   | 180 | HD  | 0   |      | <u>0361</u>   | 00005  | Receiving Application                   |
| 6   | 180 | HD  | 0   |      | <u>0362</u>   | 00006  | Receiving Facility                      |
| 7   | 26  | TS  | R   |      |               | 00007  | Date/Time Of Message                    |
| 8   | 40  | ST  | 0   |      |               | 00008  | Security                                |
| 9   | 13  | CM  | R   |      | <u>0076</u> / | 00009  | Message Type                            |
|     |     |     |     |      | <u>0003</u>   |        |                                         |
| 10  | 20  | ST  | R   |      |               | 00010  | Message Control ID                      |
| 11  | 3   | PT  | R   |      |               | 00011  | Processing ID                           |
| 12  | 60  | VID | R   |      | <u>0104</u>   | 00012  | Version ID                              |
| 13  | 15  | NM  | 0   |      |               | 00013  | Sequence Number                         |
| 14  | 180 | ST  | 0   |      |               | 00014  | Continuation Pointer                    |

| 21  | 10  | ID  | 0   | Y    | 0449          | 01598  | Conformance Statement ID                |

HL7 Attribute Table - MSH - Message Header

2.16.9.0 MSH field definitions

2.16.9.1 MSH-1 Field separator (ST) 00001

Definition: This field contains the separator between the segment ID and the first real field, *MSH-2-encoding characters*. As such it serves as the separator and defines the character to be used as a separator for the rest of the message. Recommended value is |, (ASCII 124).

#### 2.16.9.2 MSH-2 Encoding characters (ST) 00002

Definition: This field contains the four characters in the following order: the component separator, repetition separator, escape character, and subcomponent separator. Recommended values are ^~\& (ASCII 94, 126, 92, and 38, respectively). See Section 2.8, "MESSAGE DELIMITERS."

#### 2.16.9.3 MSH-3 Sending application (HD) 00003

Components: <namespace ID (IS)> ^ <universal ID (ST)> ^ <universal ID type (ID)>

Definition: This field uniquely identifies the sending application among all other applications within the network enterprise. The network enterprise consists of all those applications that participate in the exchange of HL7 messages within the enterprise. Entirely site-defined. <u>User-defined Table 0361-</u> <u>Sending/receiving application</u> is used as the user-defined table of values for the first component.

| User-defined | Table 0361 - | - Sending/rece | eiving application |
|--------------|--------------|----------------|--------------------|
|              |              |                |                    |

|   | Value | Description                 |
|---|-------|-----------------------------|
| I |       | No suggested values defined |

**Note:** By site agreement, implementors may continue to use <u>User-defined Table 0300 – Namespace ID</u> for the first component.

#### 2.16.9.4 MSH-4 Sending facility (HD) 00004

```
Components: <namespace ID (IS)> ^ <universal ID (ST)> ^ <universal ID type (ID)>
```

Definition: This field further describes the sending application, *MSH-3-sending application*. With the promotion of this field to an HD data type, the usage has been broadened to include not just the sending facility but other organizational entities such as a) the organizational entity responsible for sending application; b) the responsible unit; c) a product or vendor's identifier, etc. Entirely site-defined. <u>User-defined Ta-ble 0362 – Sending/receiving facility</u> is used as the HL7 identifier for the user-defined table of values for the first component.

User-defined Table 0362 – Sending/receiving facility

|       |                        | Value | Description                                              |                            |
|-------|------------------------|-------|----------------------------------------------------------|----------------------------|
|       |                        |       | No suggested values defined                              |                            |
| Note: | By site ag<br>componer | , ,   | ers may continue to use <u>User-defined Table 0300 –</u> | Namespace ID for the first |

#### 2.16.9.5 MSH-5 Receiving application (HD) 00005

Components: <namespace ID (IS)> ^ <universal ID (ST)> ^ <universal ID type (ID)>

Definition: This field uniquely identifies the receiving application among all other applications within the network enterprise. The network enterprise consists of all those applications that participate in the exchange of HL7 messages within the enterprise. Entirely site-defined. <u>User-defined Table 0361-</u> <u>Sending/receiving application</u> is used as the HL7 identifier for the user-defined table of values for the first component.

**Note:** By site agreement, implementers may continue to use <u>User-defined Table 0300 – Namespace ID</u> for the first component.

#### 2.16.9.6 MSH-6 Receiving facility (HD) 00006

Components: <namespace ID (IS)> ^ <universal ID (ST)> ^ <universal ID type (ID)>

Definition: This field identifies the receiving application among multiple identical instances of the application running on behalf of different organizations. <u>User-defined Table 0362 – Sending/receiving facility</u> is used as the HL7 identifier for the user-defined table of values for the first component. Entirely site-defined.

**Note:** By site agreement, implementers may continue to use <u>User-defined Table 0300 – Namespace ID</u> for the first component.

#### 2.16.9.7 MSH-7 Date/time of message (TS) 00007

Definition: This field contains the date/time that the sending system created the message. If the time zone is specified, it will be used throughout the message as the default time zone.

**Note:** This field was made required in version 2.4. Messages with versions prior to 2.4 are not required to value this field. This usage supports backward compatibility.

#### 2.16.9.8 MSH-8 Security (ST) 00008

Definition: In some applications of HL7, this field is used to implement security features. Its use is not yet further specified.

#### 2.16.9.9 MSH-9 Message type (CM) 00009

Components: <message type (ID)> ^ <trigger event (ID)> ^ <message structure (ID)>

Definition: This field contains the message type, trigger event, and the message structure ID for the message.

The first component is the message type code defined by <u>*HL7 Table 0076 - Message type*</u>. This table contains values such as ACK, ADT, ORM, ORU etc. See section 2.17.1 or Appendix A for complete listing.

The second component is the trigger event code defined by <u>*HL7 Table 0003 - Event type*</u>. This table contains values like A01, O01, R01 etc. See section 2.17.2 or Appendix A for a complete listing

The third component is the abstract message structure code defined by <u>HL7 Table 0354 - Message struc-</u> <u>ture</u>. This table has two columns. The first column contains the value of this code, which describes a particular HL7 "abstract message structure definition" in terms of segments, as defined in sections 2.12, "CHAPTER FORMATS FOR DEFINING HL7 MESSAGES" and 2.12.1, "HL7 abstract message syntax example". The second column of table 0354 lists the various HL7 trigger events that use the particular abstract message definition. For example, the message structure code ADT\_A01 describes the single abstract message structure used by the trigger events A01, A04, A05, A08, A13, A14, A28 and A31. See section 2.17.3 or Appendix A for a complete listing.

The receiving system uses this field to recognize the data segments, and possibly, the application to which to route this message. For certain queries, which may have more than a single response event type, the second component may, in the response message, vary to indicate the response event type. See the discussion of the display query variants in chapter 5. The second component is not required on response or acknowl-edgment messages.

#### 2.16.9.10 MSH-10 Message control ID (ST) 00010

Definition: This field contains a number or other identifier that uniquely identifies the message. The receiving system echoes this ID back to the sending system in the Message acknowledgment segment (MSA).

#### 2.16.9.11 MSH-11 Processing ID (PT) 00011

Components: <processing ID (ID)> ^ <processing mode (ID)>

Definition: This field is used to decide whether to process the message as defined in HL7 Application (level 7) Processing rules. The first component defines whether the message is part of a production, training, or debugging system (refer to <u>HL7 Table 0103 - Processing ID</u> for valid values). The second component defines whether the message is part of an archival process or an initial load (refer to <u>HL7 Table 0207 - Processing mode</u> for valid values). This allows different priorities to be given to different processing modes.

|-------|-------------|---|
| Value | Description |   |
| D     | Debugging   |   |
| Р     | Production  |   |
| Т     | Training    |   |

HL7 Table 0103 - Processing ID

HL7 Table 0207 - Processing mode

| Value       | Description                                                           |
|-------------|-----------------------------------------------------------------------|
| A           | Archive                                                               |
| R           | Restore from archive                                                  |
| I           | Initial load                                                          |
| Т           | Current processing, transmitted at intervals (scheduled or on demand) |
| Not present | Not present (the default, meaning <i>current</i> processing)          |

#### 2.16.9.12 MSH-12 Version ID (VID) 00012

 $\texttt{Components:} \quad \texttt{(version ID (ID))} \land \texttt{(internationalization code (CE)} \land \texttt{(internal version ID (CE)} \land \texttt{(internal ve$ 

Definition: This field is matched by the receiving system to its own version to be sure the message will be interpreted correctly. Beginning with Version 2.3.1, it has two additional "internationalization" components, for use by HL7 international affiliates. The <internationalization code> is CE data type (using the ISO country codes where appropriate) which represents the HL7 affiliate. The <internal version ID> is used if the HL7 Affiliate has more than a single 'local' version associated with a single US version. The <internal version ID> has a CE data type, since the table values vary for each HL7 Affiliate.

| Value | Description   | Date           |
|-------|---------------|----------------|
| 2.0   | Release 2.0   | September 1988 |
| 2.0D  | Demo 2.0      | October 1988   |
| 2.1   | Release 2. 1  | March 1990     |
| 2.2   | Release 2.2   | December 1994  |
| 2.3   | Release 2.3   | March 1997     |
| 2.3.1 | Release 2.3.1 | May 1999       |
| 2.4   | Release 2.4   | November 2000  |

HL7 Table 0104 - Version ID

2.16.9.13 MSH-13 Sequence number (NM) 00013

Definition: A non-null value in this field implies that the sequence number protocol is in use. This numeric field is incremented by one for each subsequent value.

2.16.9.14 MSH-14 Continuation pointer (ST) 00014

Definition: This field is used to define continuations in application-specific ways.

Only the sender of a fragmented message values this field.

#### 2.16.9.15 MSH-15 Accept acknowledgment type (ID) 00015

Definition: This field identifies the conditions under which accept acknowledgments are required to be returned in response to this message. Required for enhanced acknowledgment mode. Refer to <u>HL7 Table</u> <u>0155 - Accept/application acknowledgment conditions</u> for valid values.

#### 2.16.9.16 MSH-16 Application acknowledgment type (ID) 00016

Definition: This field contains the conditions under which application acknowledgments are required to be returned in response to this message. Required for enhanced acknowledgment mode.

The following table contains the possible values for *MSH-15-accept acknowledgment type* and *MSH-16-application acknowledgment type*:

| Value | Description                  |
|-------|------------------------------|
| AL    | Always                       |
| NE    | Never                        |
| ER    | Error/reject conditions only |
| SU    | Successful completion only   |

HL7 Table 0155 - Accept/application acknowledgment conditions

**Note:** If *MSH-15-accept acknowledgment type* and *MSH-16-application acknowledgment type* are omitted (or are both null), the original acknowledgment mode rules are used.

#### 2.16.9.17 MSH-17 Country code (ID) 00017

Definition: This field contains the country of origin for the message. It will be used primarily to specify default elements, such as currency denominations. The values to be used are those of ISO 3166, which are reprinted here upon written approval from ANSI.<sup>2</sup>. The ISO 3166 table has three separate forms of the country code: HL7 specifies that the 3-character (alphabetic) form be used for the country code.

Refer to <u>*HL7 Table 0399 – Country code</u>* for the 3-character codes as defined by ISO 3166 table.</u>

| Value | Description                 |

2.16.9.18 MSH-18 Character set (ID) 00692

Definition: This field contains the character set for the entire message. Refer to <u>HL7 Table 0211 - Alternate character sets</u> for valid values.

| Value     | Description                                                                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ASCII     | The printable 7-bit ASCII character set. (This is the default if this field is omitted)                                                                        |
| 8859/1    | The printable characters from the ISO 8859/1 Character set                                                                                                     |
| 8859/2    | The printable characters from the ISO 8859/2 Character set                                                                                                     |
| 8859/3    | The printable characters from the ISO 8859/3 Character set                                                                                                     |
| 8859/4    | The printable characters from the ISO 8859/4 Character set                                                                                                     |
| 8859/5    | The printable characters from the ISO 8859/5 Character set                                                                                                     |
| 8859/6    | The printable characters from the ISO 8859/6 Character set                                                                                                     |
| 8859/7    | The printable characters from the ISO 8859/7 Character set                                                                                                     |
| 8859/8    | The printable characters from the ISO 8859/8 Character set                                                                                                     |
| 8859/9    | The printable characters from the ISO 8859/9 Character set                                                                                                     |
| ISO IR14  | Code for Information Exchange (one byte)(JIS X 0201-1976). Note that the code contains a space, i.e. "ISO IR14".                                               |
| ISO IR87  | Code for the Japanese Graphic Character set for information interchange (JIS X 0208-1990), Note that the code contains a space, i.e. "ISO IR87".               |
| ISO IR159 | Code of the supplementary Japanese Graphic Character set for information interchange (JIS X 0212-1990). Note that the code contains a space, i.e. "ISO IR159". |
| UNICODE   | The world wide character standard from ISO/IEC 10646-1-19933                                                                                                   |

HL7 Table 0211 - Alternate character sets

Note: The field separator character <u>must</u> still be chosen from the printable 7-bit ASCII character set.

The repetitions of this field to specify different character sets apply only to fields of the, FT, ST, and TX data types.

The field *MSH-18-character set* is an optional, repeating field of data type ID, using IDs outlined in <u>*HL7*</u> <u>*Table 0211 - Alternate character sets*</u> (or equivalents from "ISO 2375").

- if the field is not valued, the default single-byte character set (ASCII ("ISO IR6")) should be assumed. No other character sets are allowed in the message.
- if the field repeats, but the first element is NULL (i.e., present but unvalued), the single-byte ASCII ("ISO IR6") is assumed as the default character set.
- if the sequence is present and the first element is specified, this character set is regarded as the default character set for the message. This must be a single-byte character set (i.e., "ISO IR6", "ISO IR13", "ISO IR14", "ISO IR100", etc.).
- elements in the remainder of the sequence (i.e., elements 2..n) are alternate character sets that may be used. These may include multi-byte character sets (i.e., JIS X 0208).
- the default character set should always be a single-byte character set. It should always have "ISO IR6" (ISO 646) or "ISO IR14" (JIS X 0201-1976) in the G0 area.

#### 2.16.9.19 MSH-19 Principal language of message (CE) 00693

Components: <identifier (ST)> ^ <text (ST)> ^ <name of coding system (IS)> ^ <alternate identifier (ST)> ^ <alternate text (ST)> ^ <name of alternate coding system (IS)>

Definition: This field contains the principal language of the message. Codes come from ISO 639.

2.16.9.20 MSH-20 Alternate character set handling scheme (ID) 01317

Definition: When any alternative character sets are used (as specified in the second or later components of *MSH-18 character sets*), and if any special handling scheme is needed, this component is to specify the scheme used, according to <u>*HL7 Table 0356- Alternate character set handling scheme*</u> as defined below:

| Value             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ISO 2022-<br>1994 | This standard is titled "Information Technology - Character Code Structure and Extension Technique". This standard specifies an escape sequence from basic one byte character set to specified other character set, and vice versa. The escape sequence explicitly specifies what alternate character set to be evoked. Note that in this mode, the actual ASCII escape character is used as defined in the referenced ISO document. As noted in 1.6.1., escape sequences to/from alternate character set should occur within HL7 delimiters. In other words, HL7 delimiters are basic one byte characters only, and just before and just after delimiters, character encoding status should be the basic one byte set. |
| 2.3               | The character set switching mode specified in HL7 2.3, sections 2.8.28.6.1, and 2.9.2. Note that the escape sequences used in this mode do not use the ASCII "esc" character. They are "HL7 escape sequences" as defined in HL7 2.3, sec. 2.9 as defined in ISO 2022-1994 (Also, note that sections 2.8.28.6.1and 2.9.2 in HL7 2.3 correspond to sections 2.8.31.6.1and 2.9.2 in HL7 2.4.)                                                                                                                                                                                                                                                                                                                              |
| <null></null>     | This is the default, indicating that there is no character set switching occurring in this message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

HL7 Table 0356 - Alternate character set handling scheme

#### 2.16.9.21 MSH-21 Conformance statement ID (ID) 01598

Definition: Sites may use this field to assert adherence to a Conformance Statement published by HL7 or by a site. Conformance Statements contain detailed explanations of grammar, syntax, and usage for a particular message or set of messages. Examples of the use of Conformance Statements appear in Chapter 5, "Query."

Repetition of this field allows more flexibility in creating and naming conformance statements. For example, the first repetition could reference a standard conformance statement, and the second, just some changes to it.

Values for HL7-standard conformance statements appear in <u>HL7 Table 0449 - Conformance statements</u> as defined below.

**Note:** As HL7 technical committees ballot conformance statements, table 449 will be populated with their identifiers. No identifiers have been issued as of v 2.4. As with any HL7 table, this table may be extended with site-defined identifiers.

#### 2.16.10 NTE - notes and comments segment

The NTE segment is defined here for inclusion in messages defined in other chapters. It is commonly used for sending notes and comments.

| SEQ | LEN   | DT | OPT | RP/# | TBL#        | ITEM # | ELEMENT NAME      |
|-----|-------|----|-----|------|-------------|--------|-------------------|
| 1   | 4     | SI | 0   |      |             | 00096  | Set ID - NTE      |
| 2   | 8     | ID | 0   |      | <u>0105</u> | 00097  | Source of Comment |
| 3   | 65536 | FT | 0   | Y    |             | 00098  | Comment           |
| 4   | 250   | CE | 0   |      | <u>0364</u> | 01318  | Comment Type      |

2.16.10.0 NTE field definitions

#### 2.16.10.1 NTE-1 Set ID - NTE (SI) 00096

Definition: This field may be used where multiple NTE segments are included in a message. Their numbering must be described in the application message definition.

2.16.10.2 NTE-2 Source of comment (ID) 00097

Definition: This field is used when source of comment must be identified. This table may be extended locally during implementation. Refer to <u>*HL7 Table 0105 - Source of comment*</u> for valid values.

| Value | Description                                        |
|-------|----------------------------------------------------|
| L     | Ancillary (filler) department is source of comment |
| Р     | Orderer (placer) is source of comment              |
| 0     | Other system is source of comment                  |

#### 2.16.10.3 NTE-3 Comment (FT) 00098

Definition: This field contains the comment contained in the segment.

**Note:** In the current HL7 version, this is a FT rather than a TX data type. Since there is no difference between a FT data type without any embedded formatting commands, and a TX data type, this change is compatible with the previous version.

#### 2.16.10.4 NTE-4 Comment type (CE) 01318

Components: <identifier (ST)> ^ <text (ST)> ^ <name of coding system (IS)> ^ <alternate identifier (ST)> ^ <alternate text (ST)> ^ <name of alternate coding system (IS)>

Definition: This field contains a value to identify the type of comment text being sent in the specific comment record. Refer to *User-defined Table 0364 - Comment type* for suggested values.

| Value | Description            |
|-------|------------------------|
| PI    | Patient Instructions   |
| AI    | Ancillary Instructions |
| GI    | General Instructions   |
| 1R    | Primary Reason         |
| 2R    | Secondary Reason       |
| GR    | General Reason         |
| RE    | Remark                 |

| User-defined Table 0364 - Comment ty | /pe |
|--------------------------------------|-----|
|--------------------------------------|-----|

| Value | Description                  |
|-------|------------------------------|
| DR    | Duplicate/Interaction Reason |

**Note:** A field already exists on the NTE record that identifies the Sources of Comment (e.g., ancillary, placer, other). However some applications need to support other types of comment text (e.g., instructions, reason, remarks, etc.). A separate NTE segment can be used for each type of comment (e.g., instructions are on one NTE and remarks on another NTE).

# 2.17 MISCELLANEOUS HL7 TABLES USED ACROSS ALL CHAPTERS

## 2.17.1 Message type table

| Message | Description                                                       | Chapter |
|---------|-------------------------------------------------------------------|---------|

# 2.17.4 Data types table

The LEN column in the data types table specifies the maximum length where there is an agreed upon specification across chapters

| Value | Description                         | LEN | Table#             | Comment                                                                                                                                                                                 | HL7 Section<br>Reference |

<sup>4</sup> The HCPCS code is divided into three "levels." Level I includes the entire CPT-4 code by reference. Level II includes the American Dental Association's Current Dental Terminology (CDT-2) code by reference. Level II also includes the genuine HCPCS codes, approved and maintained jointly by the Alpha-Numeric Editorial Panel, consisting of HCFA, the Health Insurance Association of America, and the Blue Cross and Blue Shield Association. Level III are codes developed locally by Medicare carriers. The HCPCS modifiers are divided into the same three levels, I being CPT-4 modifiers, II CDT-2 and genuine HCPCS modifiers, and III being locally agreed modifiers.

The genuine HCPCS codes and modifiers of level II can be found at <u>http://www.hcfa.gov/stats/anhcpcdl.htm</u>. HCFA distributes the HCPCS codes via the National Technical Information Service (NTIS, <u>www.ntis.gov</u>) and NTIS distribution includes the CDT-2 part of HCPCS Level II, but does not include the CPT-4 part (Level I). HCFA may distribute the CPT-4 part to its contractors.

They are linked to the record number<br>codes listed above.                                                                                                                                                                                                                                                                                               | Drug code                  |

# 2.17.6 Yes/no indicator table

The actual interpretation of Yes/No is context sensitive. Individual chapters will further refine the meaning of Yes/No in their specific context.

| Value | Description |
|-------|-------------|
| Y     | Yes         |
| N     | No          |

HL7 Table 0136 - Yes/no indicator

# 2.18 SAMPLE CONTROL MESSAGES

## 2.18.1 General acknowledgment

LAB acknowledges the message that ADT sent identified as ZZ9380. (LAB and ADT, the sending and receiving system IDs, are site-defined.) Both systems are associated with the same FACILITY, 767543. The **AA** code in the MSA segment indicates that the message was accepted by the application.

MSH|^~\&|LAB|767543|ADT|767543|19900314130405||ACK^^ACK\_ACK|XX3657|P|2. 4<cr>MSA|AA|ZZ9380<cr>

# 2.18.2 Error return

The **AR** code in MSA indicates that the application rejected the message for functional reasons. The optional ERR segment includes here that the 16th field of the PID segment with the SET ID value of 1 had an error which was defined by the locally-established code X3L. The optional text message UNKNOWN COUNTY CODE in the link is designed to help programmers and support personnel while reviewing message logs.

> MSH|^~\&|LAB|767543|ADT|767543|199003141304-0500|| ACK^^ACK\_ACK |XX3657|P|2.4<cr> MSA|AR|ZZ9380|UNKNOWN COUNTY CODE<cr> ERR|PID^1^16^X3L<cr>

## 2.18.3 Sequence number: initial message

The sender initiates the link with a message that has no functional content. The sequence number is 0. The message type and event code are not used.

 $\texttt{MSH} \ | \ ^{\sim} \ (\texttt{ADT} \ | \ 767543 \ | \ \texttt{LAB} \ | \ 767543 \ | \ \texttt{199003141304-0500} \ | \ | \ ^{\circ} \ | \ \texttt{XX3657} \ | \ \texttt{P} \ | \ \texttt{2.4} \ | \ \texttt{0} < \ \texttt{cr} > \ \texttt{Cr} > \ \texttt{Cr} > \ \texttt{MSH} \ | \ ^{\circ} \ (\texttt{ADT} \ | \ \texttt{ADT} \$ 

The responder uses a general acknowledgment. The expected sequence number is 1.

MSH|^~\&|LAB|767543|ADT|767543|199003141304-0500|| ACK^^ACK\_ACK |ZZ9380|P|2.4<cr>MSA|AA|XX3657||1<cr>

# 2.18.4 Example of message fragmentation

This summarizes the methodology for splitting a single logical HL7 message among two or more actual HL7 messages. The actual specifications for this, the segment definitions of the ADD and DSC segments, and examples are in Section 2.14.2, "Continuation messages and segments".

Continuing of messages is a generic methodology that can be used for all HL7 message types. It can be used to split based on segment boundaries, on field boundaries, and to split a single field among several messages. It utilizes two specific segments, ADD and DSC, as well as a field in the message header, *MSH-14-Continuation pointer*.

When a message is continued, a unique continuation value is used. This same value will appear in MSH-14 and DSC-1 as appropriate for a single pair of messages. This allows messages to be "chained together".

Here are two examples of ways to create continuation pointers for fragmented messages. The only absolute requirement is that when the sending application values the continuation pointer, the receiving application can appropriately reconstruct the message.

Sitecode-interfaceapplicationcode-date-sequentialcounterwithindate

This will guarantee uniqueness of this field.

e.g. BWH-LDS-19990331-27 for the 27<sup>th</sup> large message to be created on March 31, within the Discharge Summary interfaces at BWH

An alternative method of valuing the continuation pointer:

Sitecode-interfaceapplicationcode-medicalrecordnumber-datetime

e.g. MGH-PCIS-1234567-19980331121314 for a message created on March 31, at 12:13:14pm for patient medical record number 1234567, within the PCIS interfaces at MGH

Sending Application Note: In the ADD segment, a trailing field delimiter, i.e. the vertical bar character, after the final field, has explicit meaning. The sending application should not include a trailing field delimiter for the last field in the ADD segment unless it has completely valued the entire field from the message being continued.

Receiving Application Note: The receiving application will need to be concerned with a single segment and a single field being continued.

Receiving a message with an empty ADD segment followed by a DSC segment is the notification that the segment preceding the ADD is being continued in a subsequent message. Note that the continuing message may not be the next one received! The receiver must match up the continuation pointer value from MSH-14 of subsequent messages to the DSC-1 continuation pointer value of the prior message. Also if the continuing message contains an ADD segment, the receiver should continue appending to the fields from the segment being continued with values from the ADD segment. For example, if OBX-5 is being continued, the continuation will appear in ADD-1 of the continuing message, assuming that the remainder of the OBX segment fit into the single ADD segment.

Question: if continuing a message after the completion of a complete segment, should the continuing message have an empty ADD segment or not? Answer: No. This means that a continuing message need not have an ADD segment, if the continued message was split on a segment boundary.

Notation conventions: items within angle brackets are comments and not intended to represent a portion of an actual message. For example, <this is a comment>.

Note the multiple continuation pointer values, one for each pair of physical messages.

The following examples discuss an unsolicited transmission of an observation message, ORU^R01.

The expected result values in OBX-5, Observation Value, for reports (e.g. autopsy, pathology) may exceed the message length restrictions of one or more interfaces.

Thus the OBX-5, Observation Value data element will be split into more than one message.

Here's an example intended to illustrate the interpretation of Chapter 2 and 7. It reflects a single logical message broken up into three distinct messages.

Example 1, a single field being split across three messages

# 2.18.5 Master file update examples: with original and enhanced acknowledgment protocol

This example shows the lab system using the Master Files specification to send two update test dictionary entries to an ICU system. The OM1 (observation dictionary) segment, currently under development by HL7 and ASTM, carries the dictionary information. Several varieties of acknowledgment are shown. The choice of acknowledgment mode is site-specific.

2.18.5.1 Original mode example:

MSH|^~~\&|LABxxx|ClinLAB|ICU||19910918060544||MFN^MD3|MSGID002|P|2.2 MFI|LABxxx^Lab Test Dictionary^L|UPD|||AL MFE|MUP|199109051000|199110010000|12345^WBC^L OM1|... MFE|MUP|199109051015|199110010000|6789^RBC^L OM1|...

Original mode acknowledgment of the HL7 message according to MFI Response Level Code of AL.

MSH|^~\&|ICU||LABxxx|ClinLAB|19910918060545||MFK|MSGID99002|P|2.2 MSA|AA|MSGID002 MFI|LABxxx^Lab Test Dictionary^L|UPD|||MFAA MFA|MUP|199110010000|199110010040|S|12345^WBC^L MFA|MUP|199110010000|199110010041|S|6789^RBC^L

- 2.18.5.2 Enhanced mode example
- 2.18.5.2.1 Initial message with accept acknowledgment

2.18.5.3 Delayed application acknowledgment

**Note:** If the MFN message in Section 2.18.5.2, "Enhanced mode example" had not required an application acknowledgment at the message level (i.e., the application acknowledgment code of the MSH segment = NE), the (Master Files Chapter defined) MFD message could be used to provide a delayed application level acknowledgment not tied to the original MFN message.

The following example includes an acknowledgment for an MFE segment not in the original message. This additional MFE was sent via another MFN message.

2.18.5.3.1 Initial message with accept acknowledgment

# 2.19 OUTSTANDING ISSUES

The following items are being discussed in the Control/Query technical committee for addition to future versions of HL7:

- 1) Rationalization and clarification of event structures.
- 2) Creation of a network server for HL7 tables so that updates to them can be made public immediately, rather than waiting until the publication of the next version of the Standard.
- 3) Consideration of security. There are in general two types: application level security, which is partially addressed by the *security* field in the MSH segment. The second type, network security, needs to be addressed in the HL7 Implementation Guide. There are several commercially available encryption-based approaches to network level security.
- 4) Reviewing network application management messages for possible upgrade requirements.
- 5) Creation of Implementation Technology Specifications (ITSs: encoding rules equivalents) for Version 3.
- 6) Specification of query functionality for version 3.
